Notes:

1. This report contains the design details of flexible pavement for new carriageway, overlay for existing carriageway, new carriageway for service road and rigid pavement for toll plaza section.
2. The pavement design has been done in accordance with IRC clauses.
3. The data used in this report are collected by carrying out field surveys and investigations.
4. This report has been revised (Rev.1) with regards to the traffic survey conducted once again in Feb'2011 as suggested by Independent Engineer (IE). The observations of IE on Pavement Design Report, discussed during the meeting on 26/12/2011 have also been incorporated in the report.

Revision Details:

1. Traffic Report
2. Geotechnical Investigation Report

1 Introduction

The responsibility of development, maintenance and management of all National Highways has been entrusted to National Highways Authority of India (NHAI). NHAI has launched major initiatives to upgrade and strengthen National Highways through various phases of National Highways Development Programme (NHDP). Under NHDP Phase-III Programme, NHAI has envisaged 4/6 laning of approximately 12,000 kms of National Highways on BOT basis which includes the High Density Corridors/Sections of National Highways in the country. Under the said Programme, the highway section of NH-9 between Pune and Solapur from existing PWD chainage Km.144/400 to Km 249/000 (proposed chainage Km 150/400 to Km 251/400) has been envisaged for four-laning and upgrading of the existing carriageway pavement to carry the anticipated traffic over the design period.

To accomplish the said objective, NHAI has awarded the above mentioned project to IL&FS Transportation Networks Limited (ITNL) on DBFOT basis and thereby ITNL has formed a company named “Pune Solapur Road Development Company Limited” (PSRDCL) to govern the project under DBFOT format. The Concession Period for the project road is fixed as 20 years including construction period.

2 Description of the Project Corridor

The project section falls between the existing PWD chainage Km 144+400 and Km 249+000 (proposed chainage Km 150/400 to Km 251/400) of National Highway NH-9 between Pune and Solapur in the State of Maharastra. The total length of the project road is about 101 kms as per the detailed topographic Survey. The existing carriageway is of two lanes with earthen shoulder on both sides. A few sections are provided with the paved shoulder of 1m to 1.5m on both sides of the carriageway.

There are many industrial units existing along the project stretch. The project section passes through Solapur MIDC industrial zone. Substantial numbers of sugar factories are functioning abutting the project road, as the project section is one of the highest sugar producing belts. The project section passes through three major towns namely Tembhurni, Mohol and Solapur.

The project road primarily passes through the rural sections with the blend of barren land and agricultural land on both sides for most of the project length.

The existing topography reveals that the terrain of the project section is classified as plain for about 40% and as rolling for 60% of the total project length.

3 Pavement Works

The project primarily envisages strengthening of the existing two-lane carriageway and widening it to four/six lanes for augmenting capacity and significantly extending the service life of the project road under DBFOT scheme.

This chapter deals with the detailed design of pavement works pertaining to the strengthening and widening of the project road from the proposed chainage Km 150/400 to Km 251/400 including service road along the project road as mentioned in the “Manual for Specifications and Standards for Four laning of National Highways through Public Private

Partnership" published by MoRT&H. Both flexible and rigid pavements have been considered in the design.

The pavement works for implementing the above proposals will mainly consist of:

- Strengthening of the existing 2-lane main carriageway with flexible pavement.
- Construction of additional carriageways with flexible pavement to widen the existing 2-lane main carriageway to the proposed 4/6 lane configuration.
- Construction of new four lane / six-lane carriageways with flexible pavement at the bridge approaches, ROBs, stretches of proposed reconstruction etc., if required.
- Construction of service road carriageway with flexible pavement.
- Construction of rest area, truck lay-by and bus bay with flexible pavement
- Construction of toll plaza portion with rigid pavement

The pavements for the above works will be built as per appropriate designs as described in this report.

4 Structure of the Report

This report presents the design of new flexible pavement, overlay for the project road and rigid pavement for toll plaza section. The report is structured as below.

- Pavement Design Methodology
- Traffic Volume
- Axle Load Survey
- Pavement Investigation
- Geotechnical Investigations
- Design Life
- Design Traffic Load
- Flexible Pavement Design for new main carriageway – IRC Method
- Overlay Design for strengthening of existing main carriageway – IRC Method
- Flexible Pavement Design for service road – IRC Method
- Rigid Pavement Design for Toll Plaza – IRC Method

The chainages referred in this report are proposed chainages unless specified.

5 Pavement Design Methodology

Pavement design is the process of developing the most economical combination of pavement layers, with respect to thickness and type of material, to protect the soil foundation from the cumulative loading of traffic for the design life.

The IRC method has been adopted for design of different components of pavements and the pavement design has been validated by strain analysis as suggested in IRC. The pavement thickness derived from IRC method has also been validated by AASHTO method of pavement design.

5.1 New Flexible Pavement Design by IRC Method

The CBR Method of Pavement Design for multi layer pavements of granular material is recommended by IRC 37-2001 “Guidelines for the Design of Flexible Pavements” and the same has been used. Procedure for the same is given below:

- Step 1: Find out initial traffic of commercial vehicles per day by conducting continuous 7 days traffic volume count and data analysis.
- Step 2: Determine traffic growth factor by studying the past trends of traffic growth
- Step 3: Decide Design life of Pavement
- Step 4: Arrive at Vehicle Damage Factor and based on this factor, the number of commercial vehicles of different axle loads and axle configuration are converted to equivalent number of standard axle load repetition. It may be obtained by conducting axle load survey
- Step 5 : Find out distribution factor of traffic for the proposed carriageway width
- Step 6: Determine design traffic in cumulative number of Million Standard Axles (MSA)
- Step 7 : Determine total pavement thickness and crust composition by strain analysis with respect to CBR and cumulative number of Standard Axles.

The design method is based on elastic response of the pavement to traffic stresses (i.e. each of the materials in the pavement structure behaves in an elastic manner). The materials in the pavement are characterised by parameters whose values are determined from field and laboratory testing. The method assumes that failure will not occur as a result of permanent deformation of granular or bound materials (and this assumption will be valid as long as good construction procedures are followed, and the pavement is not subjected to very high wheel loads). The method also assumes that loss of pavement serviceability can occur due to:

- Fatigue of bitumen bound or cemented layers due to repetitions of tensile strains at the bottom of such layers; and/or
- Permanent deformation of the subgrade due to repeated vertical compressive strains induced in the subgrade.

The critical locations for pavement failure are therefore the bottom of bitumen bound or cemented layers (where tensile strains occur) and the top of the subgrade (where compressive strains occur).

There is no standard thickness for a pavement. Total thickness is determined by engineering design procedure. Therefore the pavement design needs to be verified against above mentioned criteria in order to arrive at the optimal pavement thickness and thereby ensure all technical requirements.

5.2 Overlay Design by IRC Method

IRC 81-1997 “Guidelines for Strengthening of Flexible Road Pavement using Benkelman Beam Deflection Technique” is used for design of overlay on existing pavement. Procedure for the same is given below

- Step 1 to step 6 are same as described in **Section 5.1** of this report.
- Step 7: Record dial gauge readings, temperatures etc by conducting Benkelman Beam Deflection Survey (BBD).

- Step 8: Determine moisture content of soil samples collected during BBD survey.
- Step 9: Determine temperature variation factor.
- Step 10: Determine moisture content factor from graphs given in IRC 81-1997.
- Step 11: Determine characteristic deflection
- Step 12: Determine overlay thickness using Fig 9 of IRC 81-1997 in terms of bituminous macadam construction.
- Step 13: Convert thickness in terms of DBM/BC as per IRC 81-1997.

5.3 Rigid Pavement Design by IRC Method

IRC 58-2002 “Guidelines for the Design of Plain Jointed Rigid Pavements for Highways” is used for design of rigid pavement of new carriageway/widening. The design procedure is as stated below.

- Step 1: Stipulate design value for the various parameters.
- Step 2: Decide types and spacing between joints.
- Step 3: Select trial design thickness of pavement slab.
- Step 4: Compute the repetitions of axle loads of different magnitudes during the design period.
- Step 5: Calculate the stresses due to single and tandem axle loads and determine the Cumulative Fatigue Damage (CFD).
- Step 6: If the CFD is more than 1.0, select a higher thickness and repeat the steps 1 to 5.
- Step 7: Compute the temperature stress at the edge and if the sum of the temperature stress and flexural stress due to highest wheel load is greater than the modulus of rupture, select higher thickness and repeat the steps 1 to 6.
- Step 8: Design the pavement thickness on the basis of corner stress if no dowel bars are provided and there is no load transfer due to lack of aggregate inter-lock.

6 Traffic Volume

6.1 Classified Volume Count

The classified traffic volume count surveys were conducted for seven days 24 hours in both directions of travel at three selected locations. The schedule & locations of classified traffic volume count surveys are given in **Table 6-1**.

Table 6-1 Classified Traffic Volume Count Survey Locations

S.No.	Existing Chainage (Km)	Proposed Chainage (Km)	Duration of Survey
1	171/000	176/640	7 Days
2	220/000	225/370	7 Days
3	242/000	247/420	7 Days

Upon the review of Traffic Report and Pavement Design Report, IE adviced the Concessionaire to conduct the traffic survey once again at the same locations to substantiate the volume of traffic and axle loads. Accordingly, the 7 days traffic volume count surveys were conducted at the above said locations between 21st Feb 2011 and 2nd March 2011 under the supervision of representatives of Independent Engineer (IE). The Average Daily

Traffic arrived at from traffic survey is presented in the form of summary in **Annexure I**. The details of traffic data are given Traffic Report (RP003 Rev-1 dated 29/12/2011).

6.2 Annual Average Daily Traffic

Annual Average Daily Traffic (AADT) has been worked out using seasonal variation factor, which is given in Traffic Report. The AADT values obtained at various traffic count stations are shown in **Table 6-2**.

Table 6-2 Location wise Annual Average Daily Traffic (AADT)

Vehicle Type	Proposed Chainage Km 176.640 (in Nos)	Proposed Chainage Km 225.370 (in Nos)	Proposed Chainage Km 247/420 (Solapur Bypass) (in Nos)
Car/Jeep	2904	4513	4782
Mini Bus	41	125	103
Bus	526	939	1323
LCV	1146	1511	2511
2AT	1829	1752	3180
3AT	4076	1833	3183
MAV	1167	891	869

It is revealed from the above table that, the volume of truck traffic is reduced while passenger traffic and LCVs are increased at km 225.370 compared to those counted at Km 176.640 and Km 247.420. The reasons for such variation are stated in **Section 6.4**.

6.3 Traffic projection

The traffic growth rates established for this study are based on elasticity approach, wherein a relationship is established between traffic data and socio-economic indicators. Traffic growth rates by vehicle type for the project road have been determined up to the period 2032.

For the project road, traffic growth rates have been arrived based on the recommended elasticity and the economic growth scenarios for different vehicle types and different growth scenarios are presented in
Table 6-3. The details of traffic projection are given in **Annexure I**.

Table 6-3 Estimated Future Traffic Growth Rates

Vehicle Type	2010-2014	2015-2020	Beyond 2020
Car	7.15	6	5.5
Bus	4.5	3.6	3.3
LCV	5.20	4.2	3.85
2 Axle Trucks	3.25	3.0	2.75
3 Axle Trucks	7.15	4.80	4.40
MAV	7.15	4.80	4.40

However, the minimum traffic growth rates recommended in the Manual of Specifications and Standards for Four Laning of National Highways through Public Private Partnership is moderately higher than the growth rate derived above. For design of the pavement, higher of the two growth rates has been adopted. The traffic growth rates considered for pavement design is given in **Table 6-4**

Table 6-4 Traffic Growth Rates Considered for Design

Concession Period	Design Life	Year	Bus	LCV	Trucks		
					2-Axle	3-Axle	Multi-Axle

6.4 Homogeneous Sections based on Traffic Characteristics

The origin-destination survey was carried out with the primary objective of studying the travel pattern of goods and passenger traffic on the project corridor. The results have been used for identifying the influence area of the project road, estimation of divertible traffic, estimating the growth rates of traffic and thereby to delineate the homogeneous sections based on its traffic characteristics. The details of O-D survey are presented in Traffic report.

As per observations made during O-D survey, local inquiry and analysis of survey data; it is concluded that

- Truck traffic (2 axles, 3 axles and multi axles) takes diversion on NH-13 from junction at proposed chainage km 215.000 in Mohol town for onward destinations of Bijapur, Bangalore and Chennai.
- Passenger traffic (car, mini bus and bus) and LCVs going to / coming from Pilgrimage town of Pandharpur divert/ merge at proposed chainage km 215.000 in Mohol town.

- Most of the Passenger Traffic using the Project Road generates from Pune, Solapur, Temburni and Mohol.
- Most of the Goods Traffic coming on the project road is of through traffic generated from various places of Maharashtra and various states like Andhra Pradesh, Karnataka, Tamil Nadu and Gujarat.

The homogeneous sections have been delineated based on above inferences in order to assign traffic loading for pavement of the project main carriageway. The homogeneous sections are given in **Table 6-5**.

Table 6-5 Homogeneous Sections of Traffic Load

Homogeneous Sections	Existing Chainage		Proposed Chainage	
	From	To	From	To
HS-A	144.400	209.000	150.400	214.600
HS-B	209.000	241.000	214.600	246.610
HS-C	241.000	249.000	246.610	251.400

7 Axle Load Survey

The main objective of Axle Load Survey is to determine Vehicle Damage Factor (VDF) from the axle load spectrum data. Several factors such as gross weight, tire pressure, number of wheels and wheel configuration, number of repetitions etc. affect the design and performance of pavement. The structural damage to a pavement system is caused by the commercial vehicles, which are expected to use it during its design life. In India, overloading of trucks has assumed menacing proportions, endangering the pavement stability and road safety. The road pavement deteriorates under the action of vehicle wheel loads. The damaging effect of vehicle loads is cumulative in nature i.e. if the traffic is more and wheel loads are higher, the pavement deteriorates at higher rate. The Axle load survey was carried out at the existing chainage of Km 171.000 (proposed chainage Km 176.640) and Km 242.000 (proposed chainage Km 247.420).

The axle load survey was conducted using portable weighing pads for one day (24 hrs) at two locations. Utmost care has been taken in selecting the site for placing the pads, so that the effect of camber and longitudinal slope is nullified. The survey was conducted for one day (24 hours) in both directions with simultaneous volume count of commercial vehicles (Trucks and LCV) and random selection of vehicles for axle load measurement, ensuring a representative sample for each category of commercial vehicle including empty vehicles. A few samples of buses were also taken to weigh the axle loads.

7.1 Vehicle Damage Factor and Equivalent Single Axle Load

The concept of load equivalency is most frequently used in the empirical method of pavement design. The Equivalent Axle Load Factor (EALF) is based on a procedure of converting the number of repetitions of observed load into an equivalent number of repetitions of 8.16 tonne standard axle load. The values of EALF depend on the failure criteria employed. There are many criteria by which the effects of different loads on the pavement can be compared. Some of them are:

- Equal vertical stress criterion
- Equal vertical deflection criterion

- Equal tensile stress criterion
- Equal contact pressure criterion

The EALF based on fatigue cracking is different from that based on permanent deformation. Due to the complex interaction of a large number of variables, it might not be possible to select an EALF that can be applied to all situations. The most widely used method for determining the EALF is the one which uses the empirical equations developed from the AASHTO Road Test, according to which the damage caused increases in proportion to the fourth power of the load. For example, a 10.2 tonne axle load would result in EALF of (10.2/8.16)4 = 2.5. Thus, an increase of 25 % in the axle load would result in 2.5 times more damage. This fact becomes even more significant in India where overloading is a norm. The fourth power relationship is internationally accepted and is used for design.

From the axle-load survey, the Vehicle Damage Factor (VDF) for each type of vehicle can be determined. The vehicle damage factor is the average of the sum of equivalent single axle loads (ESALs) for the vehicle type. The cumulative ESAL is calculated using the following equation

$$ESAL = \sum_{i=1}^{i=j} \text{Initial Traffic} \times 365 \times \frac{(1+r)^n - 1}{r} \times LDF \times VDF$$

Where,

r = Annual growth rate of traffic

n = Design life in years

LDF = Lane Distribution Factor

VDF = Vehicle Damage Factor

As per IRC: 37-2001 (Clause 3.3.5.1 (iv)), pavement design of dual carriageway should be based on 75 percent of volume of commercial vehicles in one direction is assumed for pavement design. The VDF used in the design is the maximum of values obtained from the axle-load survey carried out at the existing chainages Km 171.000 (proposed chainage Km 176.640) and Km 242.000 (proposed chainage Km 247.420) of the Project road and is summarized in **Table 7-1**.

Table 7-1 VDF Values Based on Axle Load Survey

Vehicle Type	Obtained VDF for HS-A	Obtained VDF for HS-B & C	Adopted VDF for HS-A, B & C
LCV	0.73	0.73	0.73
2-Axle Truck	1.73	1.59	1.73
3-Axle Truck	3.08	2.49	3.08
Multi Axle Truck	4.24	4.47	4.47
Bus	1.13	1.13	1.13

The Equivalent Single Axle Loading for each year is calculated considering VDF stated above for each type of vehicle for Concession period of 20 years. The Million Standard Axles (MSA) computed based on ESAL for Concession period of 20 years for each homogeneous section is presented in **Annexure II**.

8 Pavement Investigation

The pavement investigation is carried out for evaluating strengthening / rehabilitation requirement of existing flexible pavement. The following activities were conducted under pavement investigation.

- Pavement Condition Survey
- Benkelman Beam Deflection Test

Each activity conducted for the project is described below.

8.1 Pavement Condition Survey

This activity was carried out prior to Benkelman Beam Deflection Test. This activity consists primarily of visual observations, supplemented by simple measurements for rut depth using a 3 meter straight edge. The following details were collected during pavement condition survey of existing pavement.

- Pavement Composition including layer type and thickness
- Shoulder composition and condition
- Cracking in %
- Revelling in %
- Potholing in %
- Rut depth
- Patching in %
- Pavement edge drop in mm
- Embankment condition
- Road Side drain type, size and condition available, if any

The data was collected during survey and recorded as per the format given in Table 2 of IRC:81-1997 and presented vide **Annexure III**. The road length is classified in to sections of equal performance in accordance with the criteria provided in **Table 8-1**

Table 8-1 Pavement Condition Criteria

Classification	Pavement Condition
Good	No cracking, rutting less than 10 mm
Fair	No cracking or cracking confirmed to single crack in the wheel track with rutting between 10 mm and 20 mm
Poor	Extensive cracking and/or rutting greater than 20 mm. Sections with cracking exceeding 20 percent shall be treated as failed

The condition of the pavement is generally observed to be varying from average to very good. The presence of some amount of alligator cracks have been observed at some sections. A few reach has been affected by ravelling which is of trivial in nature. At the time of survey, patching was observed to be minimal. As the shoulders have not been given proper compaction, the shoulder surface on a few section are observed to be irregular.

The sections as given in **Table 8-2** have been overlaid recently and thereby the condition of the same has been observed to be very good.

Table 8-2 Section of Project Road Overlaid Recently

Existing Chainage		Proposed Chainage		Length of Overlaid Sections (Km)
From	To	From	To	
157.000	164.000	162.640	169.640	7
175.000	185.000	180.640	190.640	10
219.000	240.000	224.380	245.390	21

The pavement condition strip map is attached in **Annexure-III**.

8.2 Benkelman Beam Deflection Test

Benkelman Beam Deflection test was undertaken to determine the residual strength of the existing pavement and to determine the thickness of overlay required for catering the projected traffic load.

The test was carried out in accordance with the IRC: 81-1997 “Guidelines for Strengthening of Flexible Road Pavements using Benkelman Beam Deflection Technique (First Revision)” prepared by IRC on the basis of guidelines finally approved by council in its meeting held at Darjeeling on 24.05.1996.

The Benkelman Beam deflection test was conducted once again on the sections, which were overlaid recently by PWD. The overlaid section details are given in **Table 8-2** above.

The reading taken during the tests are used for arriving at characteristic deflection. The characteristic deflection is computed for each homogeneous section. The moisture correction factor for the deflection measurements is applied to allow for seasonal variations. The subsoil moisture survey, together with experience of the Consultants in the region, is used to develop appropriate correction factors. The data collected through Benkelman Beam Deflection test along with analysis of Rebound Deflection as per Table 3 of IRC:81-1997 is presented in **Annexure IV**.

8.3 Existing Pavement Composition

The pavement composition details of the existing pavement were obtained from the examination of test pits excavated at regular intervals along the project road in both directions. The pit results are presented in **Annexure-III**. As evident from the data, it is seen that existing road has granular base and sub base thickness varying from 175 mm to 430 mm. Asphalt layer thickness varies from 90 mm to 260 mm.

9 Geotechnical Investigations

Several methods for evaluating or estimating the strength and supporting power of a sub grade are in use today, including the following:

- Loading test in the field on the sub grade itself. For example, the plate bearing test uses large circular plate, loaded to produce critical amount of deformation on the sub grade in place.
- Loading test in a laboratory using representative samples of the sub grade soil. A test commonly used is the California Bearing Ratio (CBR) test

- Evaluation based on classification of soil by identifying and testing the constituent particles of the soil.

As the pavement design method is based on layered elastic theory, it is beneficial to use elastic modulus for each pavement material and the sub grade. However, pavement materials and natural soils do not behave in a perfectly elastic manner and the determination of elastic moduli is difficult. For these reasons the sub grade strength is not specified in terms of elastic modulus but in terms of the more readily determined CBR value. As CBR is dependent on the nature of the soil, its density, and its moisture content, it is important that the CBR is determined at conditions under which the material is likely to perform in service. In the present case CBR values are obtained by laboratory tests as well as field tests (DCPT).

9.1 Soil Borrow Area

Soil sub grade is a layer of soil prepared to withstand load of road material, traffic load and environmental conditions. The load on pavement is ultimately received by the sub grade soil for dispersion to the earth mass. Therefore it is essential that at no time, the sub grade soil is overstressed meaning that the pressure transmitted on the top of the sub grade is within the allowable limit and should not cause excessive stress condition or deformation beyond elastic limit. Soils that can be used in sub grade and embankment are identified from various borrow -areas located in vicinity of project road.

9.1.1 Objectives

The investigations on borrow areas are carried out with the following basic objectives:

- Source location indicating places, kilometre stone and lead distances and the status whether in operation or new sources.
- To assess source, indicating the direction and nature of the access road i.e. left/right of project road and approximate lead distance.
- Ownership of land, (Government or Private)
- Testing of Borrow area soils to indicate the quality of materials along with their classification details and suitability.
- Probable use indicating the likely use of soils at various stages of construction work, i.e. fill material, sub grade etc.

9.2 Sub-grade Type and Characteristics

Investigations were carried out to assess the type and strength of existing sub-grade soil along the alignment of both the existing as well as proposed carriageways. Further tests from pits (1m x 1 m) were conducted along the corridor of proposed route of new four-lane carriageway to determine the strength of the foundation strata (sub- grade) in terms of CBR.

Soaked CBR on sub-grade samples vary from 4% to 28%. The test results and other characteristics of soil sub-grade are presented in **Annexure-V**.

The test results show that there is good subgrade soil available along most of the corridor having more than 10% CBR value. In order to ensure uniform and reliable pavement strength, it is proposed to build new / widened pavement on a proposed sub-grade layer of 500mm thick using selected barrow material with soaked CBR more than l5%. Accordingly, the CBR value of 12% has been adopted for design.

9.3 Borrow Areas

Investigation of Borrow area for road construction has been carried out to identify the potential sources for embankment fill material and sub grade material for new carriageway / widened portion and to assess the general availability, nature and quantum of materials available for the project.

The detailed survey of probable borrow areas was carried out by Material Engineer. Locations mentioned below are identified as borrow areas for the soil that can be used for road embankment as well as for sub grade. The visual assessment for suitable quantities available from soil borrow areas is made. The details of available source, location, average lead distance to the project roads are given in **Table 9-1**.

Table 9-1 Details of Borrow Soil

S.No	Borrow Area Location (Existing Chainage)	CBR Value (%)
1	Km. 250+100 R/S-10 Km.	22.9
2	Km. 248+960 L/S-7.2 Km.	18.1
3	Km. 248+960 L/S-5.0 Km.	15.1
4	Km 248+980 L/S-4.5 Km	29.6
6	Km 218+580 L/S-2.4 Km	17.8
7	Km 210+340 R/S-0.8 Km	30.5
8	Km 210+340 R/S-1.0 Km	28.0
9	Km 225+550 R/S-0.8 Km	15.0
10	Km 237+950 L/S-4.0 Km	30.0

Soil samples collected from borrow areas are tested for Gradation, Atterberg limit, Modified Maximum Dry Density / Optimum moisture content and CBR at three energy level. All these parameters are tested in accordance with following Bureau of Indian Standards.

Grain Size Analysis	-	As per IS: 2720(Part 4)-1985
Atterberg Limit	-	As per IS: 2720(Part 5)-1985
Modified Maximum Dry Density and Optimum Moisture Content	-	As per IS: 2720(Part 8)-1983
CBR at Three Energy Level	-	As per IS: 2720(Part 16)-1987
Determinations of Organic Matter	-	As per IS: 2720(Part 22)-1978

The summary of geotechnical test results is presented in **Annexure-V.**

Although, the CBR values of barrow materials ranges from 15.1% to 30.5%, the CBR considered for pavement design is restricted to 12%.

9.4 Quarry Materials for Construction

A comprehensive survey of available quarry materials has been done for construction in various components of road: Bituminous Concrete. Dense Bituminous Macadam (DBM), Bituminous Macadam (BM), Wet Mix Macadam (WMM), Granular Sub-base, sand for cement concrete works, gravel etc.

9.4.1 Objectives

The investigations on materials are carried out with the following basic objectives:

- Source location indicating places, kilometre stone, lead distances and status whether in operation or new sources.
- To assess source indicating the direction and nature of the access road i.e. left / right of the project road. Approximate lead distance.
- Ownership of quarries whether Government or Private
- Testing and analysis of materials to indicate the quality and suitability for construction works
- Probable indications of likely use at various stages of construction work i.e. sub-base, bituminous course and Cross Drainage Structures.

9.4.2 Stone Aggregates

Aggregate quarries located in the vicinity of project area have been inspected and the details on number of crushers working over there along with production capacity were collected which is depicted in **Table 9-2**.

Table 9-2 Details of Aggregate Source and its Parameters

S.No	*Source*	*Location (Existing Chainage)*	*Available Material Size*
1	Gangawadi Quarry (Maytas Crusher)	Km 248+960 LHS 18 Km From NH 9	20 mm
			10 mm
2	Sachin Chowhan Crusher	Km 232+600 LHS 2.0 Km From NH 9	40 mm
			20 mm
			10 mm
			Crushed Sand
3	Agam RMC	Km 239+200 LHS 8 Km From NH 9	20 mm
			10 mm
			Crushed Sand
4	Gaykwad Crusher	Km 140+000 RHS 1 Km From NH 9	20 mm
			10 mm
5	Tarangwadi Crusher	Km 140+000 RHS 6 Km From NH 9	40 mm
			20 mm
			10 mm
			Crushed Sand

The samples of aggregate from quarries / crushers are collected and tested to determine their suitability in the construction of various components of pavement structure. Test parameters like Crushing Strength; Impact Value, Water Absorption, Specific Gravity, Soundness test, Coating and Stripping of bitumen are applied on the aggregate samples collected from various quarries in order to determine their suitability vis-à-vis specifications. All the tests are carried out in accordance with the codes mentioned below:

Crushing Strength of Aggregate - As per IS: 2386 (Part 3)

Aggregate Impact Test	-	As per IS: 2386 (Part 3)
Water Absorption of Aggregate	-	As per IS: 2386 (Part 3)
Specific Gravity of Aggregate	-	As per IS: 2386 (Part 3)
Coating and Stripping of Bitumen Test	-	As per IS: 6241-1971
Elongation and Flakiness Index	-	As per IS: 2386 (Part 1)
Soundness Test	-	As per IS: 2386 Part - 5

9.4.2.1 Location and Description of Aggregate Quarries

Aggregate samples collected from identified sources are tested for Impact test, Water Absorption, Specific Gravity, Bitumen Coating and Stripping value and for Elongation and Flakiness tests. The summary of test results obtained is given in **Table 9-3**.

Table 9-3 Test Results of Aggregate Collected from Quarry

S. No	Source	Location (Existing Chainage)	Material	Specific Gravity	Water Absorption	AIV	Flakiness Index
1	Gangawadi Quarry (Maytas Crusher)	Km 248+960 LHS 18 Km From NH 9	20 mm	2.913	0.72	9.87	-
			10 mm	2.91	0.76		-
2	Sachin Chowhan Crusher	Km 232+600 LHS 2.0 Km From NH 9	40 mm	2.92	0.96	13.02	21.9
			20 mm	2.93	0.96		22.1
			10 mm	2.91	1.06		27.9
			Crushed Sand	2.86	1.75	-	-
3	Agam RMC	Km 239+200 LHS 8 Km From NH 9	20 mm	2.93	1.00	10.30	13.1
			10 mm	2.90	1.06		26.7
			Crushed Sand	2.79	1.90	-	-
4	Gaykwad Crusher	Km 140+000 RHS 1 Km From NH 9	20 mm	2.865	0.99	16.09	16.24
			10 mm	2.856	1.12		18.1
5	Tarangwadi Crusher	Km 140+000 RHS 6 Km From NH 9	40 mm	2.880	0.61	13.31	11.44
			20 mm	2.875	0.81		10.62
			10 mm	2.853	1.07		17.97
			Crushed Sand	2.815	1.85	-	-

The aggregate sample collected from the crusher working in the vicinity of project area were tested for the various parameters like Impact Test Water Absorption Specific Gravity Bitumen Coating & Stripping and found to be suitable for road construction as the said materials fulfil the stipulated specifications.

10 Design Life

As per Concession Agreement, the concession period for the project road is stated to be 20 years including concession period. According to section 4.4.2. of Manual of Specifications and Standards for DBFOT Road Projects 2008, the design life for flexible pavement should be 20 years. Therefore, the design life of the pavement has been taken as below.

Base Year - 2010

Construction Period – 2 ½ Years

Design Life – 20 Years

Design Year - 2032

The design life for base & sub base and bituminous surface for new carriageway and strengthening of existing carriage way are as given below.

10.1 Design Life for Base and Sub-Base

The base and sub-base courses of the new pavement have been designed for the full design life ie, the design year of 2032.

10.2 Design Life for Bituminous Surface

As per IRC 37-2007, the initial bituminous surfacing is to be designed for a minimum design period of 10 years and the pavement shall be strengthened by bituminous overlay as and when required to extend the pavement life to full operation period. Therefore, the design life with stage construction for bituminous layers have been assessed for various homogeneous sections, which are delineated based on traffic characteristics, pavement width and soil type. The pavement homogeneous sections are given in **Table 6-5.**

Therefore, stage construction has been adopted for bituminous layers with a design life of 15 years from the date of completion of construction for all three homogeneous sections.

The second stage strengthening is proposed to be done at the end of 17th year from the date of completion of construction ie, 2027.

The design life for various homogeneous sections is tabulated below in **Table 10-1**.

Table 10-1 Design Life for Homogeneous Project Sections

Stages	Proposed Chainage Km 150.400 to Km 214.600 (HS-A)	Proposed Chainage Km 214.600 to Km 246.610 (HS-B)	Proposed Chainage Km 246.610 to Km 251.400 (HS-C)
Design Year for First Stage	2027	2027	2027
Design Year for Second Stage	2032	2032	2032

The remaining life concept of stage construction is based on the assumption that the second stage will be placed before the first stage shows serious signs of distress. However, because of the functional overlays, which will be laid according to functional requirements, the functional overlays of BT layers will add strength to the pavement crust and therefore, the pavement may actually be in a better condition at the end of the first stage time period. Accordingly, the second stage overlay can be decided depending on the condition survey at that time and can be redesigned using BBD methodology or any other suitable technique.

11 Design Traffic Load

11.1 Equivalent Single Axle Load

Vehicles have many combinations of axles for distribution of the load to the pavement through the wheels. As the axle loads of different vehicles vary, these axle loads are converted into Equivalent Single Axle Loads (ESAL) for the purpose of pavement design. A standard truck has two axles, front axle with two wheels and rear axle with four wheels.

Since the design of flexible pavements is by layered theory, only the wheels on one side is considered. On the other hand, the design of rigid pavement is by plate theory and hence the wheel loads on both sides of axle is considered.

11.1.1 Legal Axle Load

The maximum allowed axle load on the roads is called Legal Axle Load. For highways the Maximum Legal Axle Load in India, specified by IRC, is 10 tonnes.

11.1.2 Standard Axle Load

It is a single axle load with dual rear wheel carrying 8.16 tonnes and the design of pavement is based on the standard axle load.

11.1.3 Repetition of Axle Loads

The deformation of pavement due to a single application of axle load may be small but due to repeated application of load there would be accumulation of unrecovered or permanent deformation, which results in failure of pavement.

The traffic loading in terms of the cumulative number of standard axles for the given period has been computed using the following relationship:

$$N_s = \sum_{i}^{DL} \sum_{i}^{n} \frac{365*ADT_i\,[(1+GR_i)^{DL}-1]\ *\ VDF_i\ *LDF}{(GR_i)}$$

Where,

Ns is cumulative number of standard axles for the period under consideration.

ADTi is average daily traffic for vehicle category "i" in the initial year.

GRi is growth rate for vehicle category.

VDFi is vehicle damage factor in terms of equivalent number standard axles for vehicle category, "i" (The VDF values for MSA calculations have been considered as mentioned in Detailed Project Report.)

DL is design life in years.

N is number of Years

LDF is lane distribution factor as per IRC: 37-2001

The cumulative million standard axles (MSA) for various homogeneous sections have been calculated and the same are summarised in the tables below. The detailed calculations for MSA are presented in **Annexure II**.

Details of CVC count are presented in Traffic report. The summary of traffic volume is attached as **Annexure - I**. The traffic study was carried out at site during December 2009 and MSA has been calculated based on the traffic volume, seasonal variation factor and VDF value. The summary of design MSA for 3 homogeneous sections is given in Tables below.

Table 11-1 Million Standard Axles for HS-A (From Km 1150.400 to Km 214.600)

Concession Period	Design Life	Year	Design MSA		Remarks
			Standard Axles in Millions	Cumulative MSA	
0	Base Year	2009	0		
1	Construction Period	2010	0

12 New Flexible Pavement Design by IRC Method

12.1 New Flexible Pavement Design for Main Carriageway widening Portion

Widening portion of existing road and realignment portion of road have been designed as new flexible pavement. IRC: 37-2001 has been followed for designing of new flexible pavement.

The proposed total thickness of pavement as per IRC: 37-2001 is presented in **Table 12-1**.

The detailed summary of pavement design is presented in **Annexure-VII**.

Table 12-1 Proposed Pavement Crust Thickness for Main Carriageway

Section	Design MSA	Design CBR (%)	BC	DBM	Base (WMM)	Sub-base (GSB)	Sub grade
HS-A	80	10	45	120	250	200	500
HS-B	52	10	40	115	250	200	500
HS-C	78	10	45	120	250	200	500

12.2 New Flexible Pavement Design for Paved Shoulder/Truck layby/Bus Bay/Rest Area

As per AASHTO, “as shoulder is the portion of the roadway continuous with the travelled way for accommodation of stopped vehicles, for emergency use and for lateral support of sub-base, base and surface course.

The factors affecting shoulder / highway facility design are similar to those of mainline pavement design. The major difference is the amount of traffic. Traffic volume on shoulders is lower than on a mainline and much difficult to predict.

Three types of traffic may be considered in shoulder design:

- Encroaching traffic
- Parking traffic, and
- Regular traffic

Regular traffic is considered only if the use of shoulder as an additional lane for peak hour or detoured traffic is anticipated. If there is no regular traffic, the sum of encroaching and parking traffic is used to design the inner edge of shoulder adjacent to the mainline; while parking traffic is used to design the outer edge of shoulder. This may turn to be uncertain predicting the traffic on the paved shoulder / facilities.

Considering this aspect, the thickness of pavement layers designed for main carriageway is adopted for paved shoulders, truck layby, rest area and bus bays.

12.3 Drainage of Sub grade

Pavement and sub grade moisture conditions exert a major influence on the performance of roads. In pavement design it is important to be able to recognise ways by which moisture may enter the pavement or sub grade and to determine measures needed to control moisture movement.

Moisture changes usually result from one or more of the following effects:

- seepage from higher ground near the road pavement;
- fluctuations in water table level;
- Infiltration of water through the surface of the road pavement and shoulders; and
- Transfer of moisture in liquid or vapor states.

In the present case, drainage layer of GSB has been proposed for effective drainage.

The widening of both left and right carriageways are proposed on right side of the existing carriageway. Therefore, the GSB layer below the median portion is proposed to be sloped towards right carriageway in order to drain off the water seeped from median top away from the existing crust on left side.

13 Overlay Design for Existing Flexible Pavement

13.1 Homogeneous Sections for Overlay Design

Performance of the flexible pavements is closely related to the elastic deflection of the pavement under the wheel loads. Hence, based on the characteristic deflection which is

obtained from the Benkelman Beam Deflection (BBD) test homogeneous sections are identified. Based on the detailed BBD data analysis which is presented in the **Annexure IV**, the characteristic deflections obtained over a project stretch are shown in the deflection chart attached in **Annexure IV**. It can be observed from the chart that the variation in deflections is significant throughout the length of the project road. The cumulative difference approach suggested by AASHTO Guide for Design of Pavement Structure is used to classify the sections which are similar in nature from the characteristic deflection. This method compares the sequence of actual cumulative sums in a measurement series with the sums that would have resulted from the adding averages.

If r_i is the pavement response value (Characteristic deflection) for the ith chainage measurement, A series Z_1, Z_2 ,…..Z_n is constructed by calculating

$$Z_X = \sum_{i=1}^{n} a_i - \frac{\sum_{i=1}^{n_t} a_i}{L_p} \sum_{i=1}^{n} x_i, \qquad \text{With } a_i = \frac{(r_{i-1} + r_i) \times x_i}{2} = \bar{r}_i \times x_i \text{ (NOTE: let } r_0 = r_1 \text{ for first interval)}$$

where

n = the nth pavement response measurement

n_t = total number of pavement response measurements taken in project

x_i = interval between two measurements

r_i = pavement response value of the ith measurement

$\bar{r}_i$ = average of the pavement response values between the (i-1) and ith tests and

L_p = total project length

According to AASHTO, a section border is indicated whenever the trend in the series of cumulative differences changes from positive to negative and vice versa. However, relatively volatile measurements series should be ignored to restrict the number of identified sections.

The adopted Characteristic Deflection for each homogeneous section is presented in **Table 13-1**.

Table 13-1 Section wise Characteristic Deflection

Homogeneous Section	Existing Chainage Start From (Km)	Existing Chainage End To (Km)	Characteristic Deflection (mm)

13.2 Overlay Design

Overlay thickness design has been derived based on characteristic deflection and projected MSA as per the design chart given in IRC: 81-1997.

Benkelman Beam Deflection studies have been carried out for evaluating the requirements of strengthening of pavements. The correction factor is applied for moisture content and Pavement Temperature as per the guidelines given in IRC: 81-1997. Deflection measurements obtained from the field surveys has been used in the analysis to determine the mean deflection, standard deviation and characteristic deflection.

Overlay with BM/DBM has been proposed over the existing road as the condition of the existing road is good to fair and there is no failure in the pavement.

Depending on the MSA and pavement characteristic deflection, overlay thickness in terms of BM (Bituminous Macadam) layer has been established as per design chart given in IRC: 81 – 1997 for each section and accordingly converted into DBM and BC. However, minimum thickness of DBM and BC is kept as 50mm and 40mm respectively in case the designed overlay thickness is lesser than the mentioned limit.

The proposed bituminous overlay for strengthening the existing pavement is presented in **Table 13-2**.

The details of overlay design are given in **Annexure – VII**.

Table 13-2 Proposed Strengthening / Overlay on Existing Road

13.3 Rehabilitation of Existing Carriageway

While formulating the proposal for strengthening of existing carriageway, the pavement investigation data ie., BBD data, existing crust composition and existing sub grade CBR have been thoroughly reviewed to derive appropriate solution to strengthen the existing crust. A sequential approach guided to draw the proposal for rehabilitation as described below.

The pavement surface condition is observed to be good in most of the project road. Therefore, the combination of BBD data and existing crust thickness data have been used to identify the section for rehabilitation. Though the pavement condition survey shows that it is functionally good, it may have happened because of periodical maintenance by rectifying potholes and functional overlays. And this aspect is supported by the fact that the characteristic deflection reported for all identified sections exhibit comparatively higher values.

It is apparent from the pit data of existing crust that these stretches are provided with frequent overlays resulting in thick bituminous layer and that might have been necessitated due to inherent problems in the weak or thin base / sub base layers. These overlays have very little contribution in structural strengthening of pavement. However, in most of the

sections, the average soaked CBR at present state of compaction are suggestive of good existing subgrade.

The identified stretches are recommended to be rehabilitated by adding 250mm thickness of WMM layer on top of existing crust after removing the existing BT layer and subsequently by laying DBM and BC layers of thickness as same as new crust for the corresponding sections. The stretches considered for rehabilitation and the proposed pavement crust details are highlighted in **Table 13-3**.

Table 13-3 Proposed Pavement Thickness for Rehabilitation of Existing Road

Homogeneous Section	Proposed Chainage From (Km)	Proposed Chainage To (Km)	Pavement Thickness (mm)			
			BC	DBM-I	DBM-II	WMM
HS 2	152.640	162.640	45	50	70	250
HS 4	166.640	174.640	45	50	70	250

HS 26	241.340	242.340	40	50	65	250

13.4 Profile Corrective Course

Before implementing the overlay, the existing surface shall be corrected and brought to proper profile by filling the cracks, potholes, ruts and undulations. No part of the overlay design thickness shall be used for correcting the surface irregularities termed as profile correcting course. The profile corrective courses are those layers laid on top of the existing carriageway, so that the finished road profile matches with shape and level of the designed road profile. These profile corrective courses consist of bituminous or granular material or both. There are six different treatments depending on the overall thickness of profile corrective course required are described as follows.

Table 13-4 Proposed Composition of Profile Corrective Course (PCC)

Type of PCC	Level Difference between bottom of proposed overlay and existing road along existing road centre line	PCC layer
1	< 40 mm	PCC by DBM
2	> 40mm and < 150mm	PCC by BM
3	> 150mm and < 300mm	Dismantle the existing bituminous course and provide bituminous layers as per new carriageway design and rest with WMM as PCC
4	>300mm and < 500mm	Dismantle the existing bituminous course and provide bituminous layers as per new carriageway design and 250mm WMM. Remaining with GSB (min. 100mm) as PCC

Type of PCC	Level Difference between bottom of proposed overlay and existing road along existing road centre line	PCC layer
5	> 500mm	Reconstruction with new carriageway pavement thickness by dismantling of existing pavement to requisite depth
6	> 1600mm	Reconstruction with new carriageway pavement thickness without dismantling the existing bituminous course

14 New Flexible Pavement Design for Service Roads

Service roads are proposed for the urban/built-up areas for effective segregation of traffic and to enforce access control measures. Carriageway width of 7.0m is proposed with footpath of 1.5m width depending on local traffic movement expected. The pavement has been designed for the anticipated traffic.

The Design of pavement layers for Service road is Carried out considering Design MSA of 5 as specified in IRC SP:84-2009 and Design CBR of 10% for entire length of the project road. The thickness of pavement layers proposed is presented in **Table 14-1**.

Table 14-1 Flexible Pavement Crust Thickness for Service Road

Section	Design MSA	Design CBR (%)	SDBC (mm)	DBM (mm)	WMM Base (mm)	GSB Sub-base (mm)	Sub grade (mm)
All Service Roads	5	10	25	50	250	150	500

15 Rigid Pavement Design for Toll Plaza Section

There are two proposed toll plaza in the section of project road one at Km 178/572 and another at Km 229/230. The rigid pavement has been designed for both toll plazas with respect to the corresponding traffic / axle load spectrum data.

There are number of pavement design methods available to determine the thickness of rigid pavements. Because, the mechanism of load carrying is different in flexible and rigid pavements, different methodologies are used for pavement thickness design. In flexible pavements loads are carried by successive layers of materials over the sub-grade. The layers behave as elastic (or Visco-Elastic) material; therefore, flexible pavements are designed using the layer theory. Rigid pavements are able to carry the load largely by their beam action, and are therefore, analysed by the plate theory, instead of the layer theory. Like flexible pavements, rigid pavements are also designed to withstand loading and environmental effects.

The most important load related parameter in the case of rigid pavements, instead of tensile strain, is the stress ratio, i.e., the ratio between the flexural stress and modulus of rupture of concrete under load repetitions. The fatigue of concrete can cause both transverse cracking and longitudinal cracking in the wheel paths.

The environmental effects manifest themselves in the form of warping and curling stresses caused by variations in moisture content with slab depth, and variations of temperature respectively. The situation of differential conditions at the slabs top and bottom is very complex, making it difficult to compute the restraining stresses. Therefore, some design methods ignore them, while others such as, IRC, and Portland Cement Association (PCA) method combine the loading and temperature stresses.

Another important mode of rigid pavement distress, in addition to fatigue failure, is the pumping and erosion of material under and beside the slab. Factors that influence pumping and erosion include the presence of water, the rate at which water is ejected from under the slab, the erodibility of the sub-base material, the magnitude and number of repeated loads, and the amount of deflection. Only the Portland Cement Association model based primarily on the results of AASHTO Road Test takes this and only the corner deflection is accounted into consideration.

Three widely accepted design methods to determine the thickness of rigid pavements currently in use are:

- IRC :58-2002; Guidelines for the Design of Plain Jointed Rigid Pavements for Highways
- Portland Cement Association (PCA); Thickness Design for Concrete Highway and Street Pavements;
- AASHTO Guide for Design of Pavement Structures

The IRC method is considered for design of rigid pavement for this project.

As IRC-58-2002 has been recently revised based on the experience gained in this country, it has been adopted for design in this project. The IRC rigid pavement design method, the pavement is designed for the maximum flexural stress due to wheel load and temperature warping stresses in the pavement due to temperature differential at the top and the bottom of the slab. For loading conditions, a load safety factor, (1.0 for local-street to 1.2 for high volume class facility) and 98 percentile axle-loads is used to calculate flexural stresses and to determine the slab thickness. The slab warping stresses are then calculated for the thickness and the local temperature conditions. If safe under the combined effect of these stresses, the pavement thickness is checked for fatigue damage due to repeated loading from single and tandem axles, to keep the damage within the allowable limits of fatigue life.

The rigid pavements on this project are designed for a life of 30 years and for the projected traffic loadings over the next 30 years. The primary tool used for design on this project, are IRC:58-2002, because this take into account combined edge loading and temperature stresses. As the Tandem axle forms small part in India, erosion analysis has not been carried out. The parameters used for the design of rigid pavement method are as follows:

For Toll Plaza at Km 178/572:

1	Design Life in Years	n	30	Years
2	DesignWheel Load	P	6258	Kg
3	Present Traffic Intensity	T_b	8829	CVD
4	Traffic Growth Rate	r	As Per Attachment	
5	28 days Compressive Strength of Concrete	f_{CK}	400	kg/cm^2
6	Flexural Strength of Concrete	F_{CR}	45.00	kg/cm^2
7	Modulus of Elasticity of Concrete	E	300000	kg/cm^2

8	Possion's Ratio of Concrete	μ	0.15	
9	Coefficient of Thermal Expansion of Concrete	a	10.0E-6	Per ^{o}C
10	Subgrade CBR (%)		7.000	
11	K Value of Sub grade	K_{sg}	4.800	kg /cm^3
12	Subbase Type (Enter Code)		3	
13	Thickness of Dry Lean Concrete		15	cm
14	K Value of Subbase	K_{sb}	27.700	kg /cm^3
15	Zone of Project Corridor for Temparature		3	No.
16	Assume Trail Slab Thickness	h	35	cm
17	Temp. Difference b/w top and bottom layers	D_t	21.00	^{o}C
18	Spacing of Contraction Joints	L	4.5	m
19	Length of Slab (Lane Width)	W	3.5	m
20	Tyre Pressure	p	8	kg/cm^2
21	C/C Distance between two tyres	S	31	cm
22	Load safety factor for Fatigue analysis	LSF	1.2	

For Toll Plaza at Km 229/230:

1	Design Life in Years	n	30	Years
2	DesignWheel Load	P	6470	Kg
3	Present Traffic Intensity	T_b	6979	CVD
4	Traffic Growth Rate	r	As Per Attachment	
5	28 days Compressive Strength of Concrete	f_{CK}	400	kg/cm^2
6	Flexural Strength of Concrete	F_{CR}	45.00	kg/cm^2
7	Modulus of Elasticity of Concrete	E	300000	kg/cm^2
8	Possion's Ratio of Concrete	μ	0.15	
9	Coefficient of Thermal Expansion of Concrete	a	10.0E-6	Per ^{o}C
10	Subgrade CBR (%)		7.000	
11	K Value of Sub grade	K_{sg}	4.800	kg /cm^3
12	Subbase Type (Enter Code)		3	
13	Thickness of Dry Lean Concrete		15	cm
14	K Value of Subbase	K_{sb}	27.700	kg /cm^3
15	Zone of Project Corridor for Temparature		3	No.
16	Assume Trail Slab Thickness	h	34	cm
17	Temp. Difference b/w top and bottom layers	D_t	21.00	^{o}C
18	Spacing of Contraction Joints	L	4.5	m
19	Length of Slab (Lane Width)	W	3.5	m
20	Tyre Pressure	p	8	kg/cm^2
21	C/C Distance between two tyres	S	31	cm
22	Load safety factor for Fatigue analysis	LSF	1.2	

Since the soaked CBR value of the sub-grade borrow material is taken as 7%, it has a 'k' value of 4.8 kg/cm^2/cm, which is less than the suggested minimum of 6.0 kg/cm^2/cm,

required for placing the slab directly over sub-grade. As per the Table-4 of IRC 58-2002 the modified K-value of DLC sub-bases 150 mm corresponding to CBR 10% is 27.70 kg/cm^3.

The IRC Guidelines suggest 25% of traffic in one direction as sufficient for design for four lane/ multi lane highways against fatigue failure, but the Portland Cement Association suggests up to that 100% of trucks in truck lane be considered in their design procedure.

The calculation of stresses i.e. edge stress due to load & temperature and corner stress for concrete is checked as per clause 5.2 of IRC: 58 - 2002. The flexural stress at edge due to the application of single or tandem axle loads for Design thickness of slab for PQC is checked as per Clause 5.4 of IRC: 58 -2002.

Although the design is done for both toll plazas separately, the thickness of PQC and DLC are proposed to be same as given in **Table 15-1**. The maximum thickness of PQC and DLC and reinforcement are proposed as per design for the location of Km 178/572.

The thickness for DLC and PQC based on procedure laid down in "Design of Rigid Pavement as per IRC: 58-2002 and the data indicated as above arrived at is as shown in **Table 15-1**.

Table 15-1 Proposed Rigid Pavement Crust Thickness for both Toll Plazas

Rigid Pavement	Pavement Quality Concrete (PQC) in "mm"	Dry Lean Concrete (DLC) in "mm"	Granular Sub Base (GSB) in "mm"
Toll Plaza	340	150	200

In addition, design of Tie bars for longitudinal joints and dowel bars for transverse joints is carried out as per clause 7.2 of IRC:58-2002. The length, spacing and diameter for tie bars and dowel bars are worked out as per the procedure. The Design for bars showing length, spacing with reference to diameter of bar is presented in Annexure IX. The proposed details of dowel and tie bars are given in **Table 15-2** and **Table 15-3** respectively.

Table 15-2 Proposed Details of Dowel Bars

Diameter of Dowel Bar	30 mm
Length of Dowel Bar	500 mm
Spacing between Dowel Bars	270 mm
Type of Dowel Bar	MS
Width of Transverse Joint	8 mm

Table 15-3 Proposed Details of Tie Bars

Diameter of Tie Bar	12 mm
Length of Tie Bar	640 mm
Spacing between Tie Bars	470 mm
Type of Tie Bar	Deformed

16 Summary of Proposals

The proposals of pavement crusts for various sections of the project highway are summarised below.

1. The flexible pavement is proposed for new main carriageway and widening portion of main carriageway as given in table below and the detailed summary is given in **Annexure VII**.

Section	Proposed Chainage	Design MSA	Design CBR (%)	Design Year for BT	BC	DBM	Design Year for Bases	Base (WMM)	Sub-base (GSB)	Sub grade
HS-A	Km150.400 to Km214.600	80	10	2027	45	120	2032	250	200	500
HS-B	Km214.600 to Km246.610	52	10	2027	40	115	2032	250	200	500
HS-C	Km246.610 to Km251.400	78	10	2027	45	120	2032	250	200	500

2. The bituminous overlay is proposed for strengthening the existing flexible pavement as given in table below and the detailed summary is given in **Annexure VII**.

Homogeneous Section	Design MSA	Proposed Chainage From (Km)	Proposed Chainage To (Km)	Characteristic Deflection (mm)	Strengthening / Overlay Thickness (mm)			
					BC	DBM-I	DBM-II	WMM
HS 1	80	151.640	152.640	1.58	45	95	0	0
HS 2	80	152.640	162.640	2.48	45	50	70	250
HS 3	80	162.640	166.640	1.44	45	90	0	0
HS 4	80	166.640	174.640	2.59	45	50	70	250
HS 5	80	174.640	176.640	1.58	45	95	0	0

HS 29	78	246.410	251.400	1.24	45	75	0	0

3. The flexible pavement of the same crust as main carriageway is proposed for paved shoulders on both sides.
4. The flexible pavement of the same crust as main carriageway is proposed for bus bays.
5. The flexible pavement of the same crust as main carriageway is proposed for truck lay-bys.
6. The flexible pavement is proposed for new service road carriageway as given in table below.

Section	Design MSA	Design CBR (%)	SDBC	DBM	Base (WMM)	Sub-base (GSB)	Sub grade
All Service Roads	5	10	25	50	250	150	500

7. The rigid pavement is proposed for the approaches of toll plaza as given in table below.

Rigid Pavement	Pavement Quality Concrete (PQC) in “mm”	Dry Lean Concrete (DLC) in “mm”	Granular Sub Base (GSB) in “mm”
Toll Plaza	340	150	200

Diameter of Dowel Bar	30 mm
Length of Dowel Bar	500 mm
Spacing between Dowel Bars	270 mm
Type of Dowel Bar	MS
Width of Transverse Joints	8 mm
Diameter of Tie Bar	12 mm
Length of Tie Bar	640 mm
Spacing between Tie Bars	470 mm
Type of Tie Bar	Deformed

Annexure II

ANNEXURE - II

IL&FS Transportation	IL&FS TRANSPORTAION NETWORKS LIMITED		
Client:	NATIONAL HIGHWAY AUTHORITY OF INDIA, NEW DELHI		
Project:	4 Laning of Pune - Solapur Section of NH-9 from Km 144.400 to Km 249.000 (Proposed Chainage - Km 150.050 to Km 251.325)	**Date:**	28/12/2011
Project No:	406 / 2009	**Des. Note No:**	DN001
Title:	Design MSA for the section from Existing Chainage Km 144.400 to Km 210.000	**Rev.No:**	F
Notes:	Data of following surveys and investigations are used to design the pavement. 1. Traffic Volume Count (--/--/--), 2. Axle Load Survey (--/--/--), VDF & MSA calculation is done in accordance with IRC:37-2001	**Designed**	M.Kanagaraj
		Checked	Hari Bhavsar
Reference:	IRC:37-2001 Guidelines for the design of flexible pavements, Manual of Specifications and Standards for Four Laning of NH through PPP	**Approved**	S C Mittal

IL&FS | Transportation	IL&FS TRANSPORTAION NETWORKS LIMITED		
Client:	NATIONAL HIGHWAY AUTHORITY OF INDIA, NEW DELHI		
Project:	4 Laning of Pune - Solapur Section of NH-9 from Km 144.400 to Km 249.000 (Proposed Chainage - Km 150.050 to Km 246.900)	Date:	28/12/2011
Project No:	406 / 2009	Des. Note No:	DN001
Title:	Flexible Pavement and Overlay Design	Rev.No:	F
Notes:	Data of following surveys and investigations are used to design the pavement. 1. Pavement condition survey (--/--/--), 2. BBD survey (--/--/--), 3. Axle Load Survey (--/--/--), 4. Traffic Survey (--/--/--), 5. CBR Tests (--/--/--). Pavement Design is done in accordance with IRC:37-2001 and overlay design is done in accordance with IRC:81-1997. Homogenious Section has been analysed by cumulative deflection approach as suggested in AASHTO Guide for Design of Pavement Structures 1993.	Designed	M.Kanagaraj
		Checked	Hari Bhavsar
Reference:	IRC:37-2001 Guidelines for the design of flexible pavements, IRC:81-1997 Guidelines for strengthening of flexible pavements using BBD technique, AASHTO Guide for Design of Pavement Structures 1993.	Approved	S C Mittal

Project:	**4 Laning of Pune - Solapur Section of NH-9 from Km 144.400 to Km 249.000 (Proposed Chainage - Km 150.050 to Km 246.900)**	**Date:**	**28/12/2011**
Project No:	**406 / 2009**	**Des. Note No:**	**DN001**
Title:	**Flexible Pavement and Overlay Design**	**Rev.No:**	**F**
Notes:	Data of following surveys and investigations are used to design the pavement. 1. Pavement condition survey (--/--/--), 2. BBD survey (--/--/--), 3. Axle Load Survey (--/--/--), 4. Traffic Survey (--/--/--), 5. CBR Tests (--/--/--). Pavement Design is done in accordance with IRC:37-2001 and overlay design is done in accordance with IRC:81-1997. Homogenious Section has been analysed by cumulative deflection approach as suggested in AASHTO Guide for Design of Pavement Structures 1993.	**Designed**	M.Kanagaraj
		Checked	Hari Bhavsar

This has reference to our meeting with your good self and Mr.Noor Alam, Pavement Expert on 10th and 11th January 2012.

The Pavement Design submitted by us on the basis of analytical design approach was reviewed and discussed in length. For the simplicity of Design we were advised to draw the pavement crust thickness directly from the plates of IRC-37-2001, Guidelines for the Design of Flexible Pavements. In addition to that, we were also suggested to provide bituminous concrete (BC) thickness of 50mm throughout the project road in order to have uniformity in wearing course. Accordingly, the Pavement Crust thickness is revised as tabulated below:

Flexible Pavement Crust Thickness for Main Carriageway

Section	Proposed Chainage	Design MSA	Design CBR (%)	BC	DBM	Base (WMM)	Sub-base (GSB)	Sub grade
HS-A	Km150.400 to Km214.600	100	10	50	130	250	200	500
HS-B	Km214.600 to Km246.610	80	10	50	125	250	200	500
HS-C	Km246.610 to Km251.400	100	10	50	130	250	200	500

Strengthening / Overlay Thickness for Existing Road

Homogeneous Section	Design MSA	Proposed Chainage From (Km)	Proposed Chainage To (Km)	Characteristic Deflection (mm)	Strengthening / Overlay Thickness (mm)

Sub.:- Design, Engineering, Construction, Development, Finance, Operation & Maintenance of 4 laning of Pune-Solapur section of NH-9 from km 144.400 to 249.000 in the state of Maharashtra under NHDP Phase III on DBFOT basis –
Approval of Pavement Design -Reg

Ref: - PSRDCL/ PRJ/ TEC/ IEO/ 848 dated 13.01.2012

Dear Sir,

Reference of your above letter, Pavement Design submitted by you has been checked and reviewed by us. Crust Thickness of Pavement has been finalized keeping in view the VDF obtained and AADT furnished by you.

1. Flexible Pavement Crust Thickness for Main Carriageway

Section	Design Traffic for 20 Years MSA (2012– 2032)	Design MSA	Design Period for Stage -I	First Stage Construction (mm)				Second Stage Construction (mm)	
				BC (mm)	DBM (mm)	WMM (mm)	GSB (mm)	BC (mm)	DBM (mm)
HS-A km 150.400 to km 214.600	140	100	2012 - 2023	50	130	250	200	50	50
HS-B Km 214.600 to km 246.610	94	90	2012 - 2026	50	125	250	200	50	50
HS-C Km 246.610 to km 251.400	140	100	2012- 2023	50	130	250	200	50	50

Note: - The second stage construction (to extend the pavement's life up to the end of operation period of 20 years) will be taken up in the year 2024 for HS-A & HS-C and 2027 for HS-B, when about 70% of the pavement life designed in first stage will be consumed.

The Crust Thickness of slip roads, acceleration and deceleration lanes, and Median openings should be same as main carriageway.

2. Strengthening/Overlay Thickness for Existing Road

Homogeneous Section	Design MSA	Proposed Chainage (km)		Characteristic Deflection (mm)	Strengthening/Overlay Thickness (mm)			
		From	To		BC	DBM-I	DBM-II	WMM
HS 01	100	151.640	152.640	1.58	50	95	0	0
HS 02	100	152.640	162.640	2.48	50	50	80	250
HS 03	100	162.640	166.640	1.44	59	90	0	0
HS 04	100	166.640	174.640	2.59	50	50	80	250
HS 05	100	174.640	176.640	1.58	50	95	0	0
HS 06	100	176.640	177.640	2.18	50	50	80	250
HS 07	100	177.640	181.640	1.70	50	50	50	0
HS 08	100	181.640	185.640	1.26	50	80	0	0
HS 09	100	185.640	188.640	1.59	50	95	0	0

HS 29	90	244.340	246.410	0.98	50	50	0	0
HS 30	100	246.410	251.400	1.24	50	65	0	0

3. Flexible Pavement Thickness for Rehabilitation of Existing Road

Homogeneous Section	Proposed Chainage		Pavement Thickness (mm)			
	From (km)	To (km)	BC	DBM-I	DBM-II	WMM
HS 02	152.640	162.640	50	50	80	250
HS 04	166.640	175.000	50	50	80	250
HS 06	176.640	177.640	50	50	80	250
HS 12	194.630	198.630	50	50	80	250
HS 17	214.000	215.000	50	50	75	250
HS 22	230.340	231.340	50	50	75	250
HS 24	233.340	235.350	50	50	75	250
HS 27	241.340	242.340	50	50	75	250

4. Flexible Pavement Crust Thickness for Service Road

Section	Design MSA	Design CBR (%)	SDBC (mm)	DBM (mm)	WMM Base (mm)	GSB Sub-base (mm)	Sub grade (mm)
All Service Roads	5	10	25	50	250	150	500

5. Rigid Pavement Crust Thickness for Toll Plaza

Rigid Pavement	Pavement Quality Concrete (PQC) in (mm)	Dry Lean Concrete (DLC) in (mm)	Granular Sub Base (GSB) in (mm)
Toll Plaza	340	150	200

6. Details of Dowel and Tie bars of Rigid Pavement for Toll Plaza.

Diameter of Dowel Bar	32 mm
Length of Dowel Bar	600 mm
Spacing between Dowel Bars	270 mm Centre to Centre
Type of Dowel Bar	M S
Width of Transverse Joints	10 mm
Width of Longitudinal Joints	8 mm
Diameter of Tie Bar	12 mm
Length of Tie Bar	640 mm
Spacing between Tie Bars	300 Centre to Centre
Type of Tie Bar	Deformed

Please you proceed your work accordingly.

Thanking you,

Yours truly,

(A.P.Singh)

1 EXECUTIVE SUMMARY

1.1 Basis of Preparation

1.1.1 General

Barwa Adda Expressway Limited (BAEL) was engaged for the construction of a six- lane highway in the Barwa – Adda section of NH-2 from Km. 398.240 to Km. 521.120 (design length of approximately 122.88 km) in the States of Jharkhand and West Bengal under National Highway Development Program Phase-V on a Design-Build-Finance-Operate-Transfer (DBFOT) basis. A concession agreement dated May 8, 2013 was entered into between the NHAI and BAEL. The project commenced tolling on April 5, 2014. The concession period for this project is 20 years commencing from April1, 2014.

M/s Roadstar Infra Investment Trust (hereinafter "**the Client**") has appointed M/s Transys consulting Pvt. Ltd. (hereinafter referred as "**Technical Consultant**") to carry out technical study and assess the Major and O&M requirements of operational asset "6-lane Barwa – Adda - Panagarh Section of NH-2 from Km 398.240 to Km 521.120 on DBFOT toll basis" in the States of Jharkhand and West Bengal (herein after refer as "**the Project**") which is being operated by "M/s Barwa Adda Expressway Limited" (hereinafter refer as "**the Concessionaire** or **BAEL**").

Table 1-1 : Description of Asset

S. No.	Stretch	States	Start (Km)	End (Km)	Length (km)	Lane configuration
1	Barwa-adda – Panagarh section of NH-2 (New NH Number-19) from Km 398.240 to Km 521.120 in the states of Jharkhand and West Bengal.	Jharkhand and West Bengal.	398+240	521+120	122.880	6Lane

1.1.2 Objective and Scope of services

This report is prepared as per scope of work defined in Work Order and directed to include in report by the Client and test report provided to us. Our work, which is summarized in this Report, has been limited to matters which we have identified that would appear to us to be of significance within the context of our scope.

The present condition of the Project Highway is reviewed based on physical site visit observations and documents and test reports provided by the Client.

This report submission covers Cost Estimate of OPEX for collection of tolls and to satisfy Operation and Maintenance requirement as per Concession Agreement and to provide performance level as per requirement of the project.

1.1.3 Sources of information

Primarily the following documents have been studied:

a) Project Document

- Concession Agreement
- Schedule A, B, C and D
- Pavement Design Report
- Plan and Profile
- Earlier Due diligence reports
- Monthly Progress Report prepared by IE
- MM works under execution.

b) Surveys & Investigations

- NSV Survey Data
- FWD Test Report with analysis
- Axle loas surveys and analysis
- Past Traffic data at toll plazas
- Existing crust

1.2 Salient Features of the project road

The major features along the project road are highlighted in following table:

Table 1-2 : Salient features of the project road

Sl. No	Particulars	
1	Start Chainage (Km)	398.240
2	End chainage (Km)	521.120
3	Length of the Project Corridor	122.88 Km
4	Concessionaire	M/s. Barwa-Adda Expressway Limited
5	Concession Period	20 years from appointed date
6	Executing agency	M/s. Barwa-Adda Expressway Limited
7	Project Cost	Rs. 1665.0 Cr (As per CA); Rs. 2434.86 Cr (As per Financial Model)
8	Date of Award	5th April 2013
9	Appointed Date	1st April 2014
10	Date of Completion	As per CA - 26/09/2016 Anticipated completion – 31/12/2023
11	No of Toll Plaza	02 Nos.
12	No of Bypass	01 Panagarh Bypass about 8.12 Km
13	Length of Service Road / Slip Road	139.508 (Including Both Sides)
14	Number of Flyovers	13 Nos.
15	Number of PUP/SVUP/LVUP/VUP	33 Nos.
16	Number of Overpasses	02 Nos.
17	Number of Minor Bridges	21 Nos.
18	Number of Major Bridges	06 Nos.
19	Number of RoB's	06 Nos.
20	Traffic& Highway Amenities	2 Way Side amenities and 2 Truck Parking
21	Number of Culverts (Pipe)	87 Nos.
22	Number of Culverts (Slab/Box)	115 Nos.
23	Number of Major Junctions	14 Nos.
24	Number of Minor junctions	40 Nos. (including both sides)

Key map showing the project road is given in the next page.

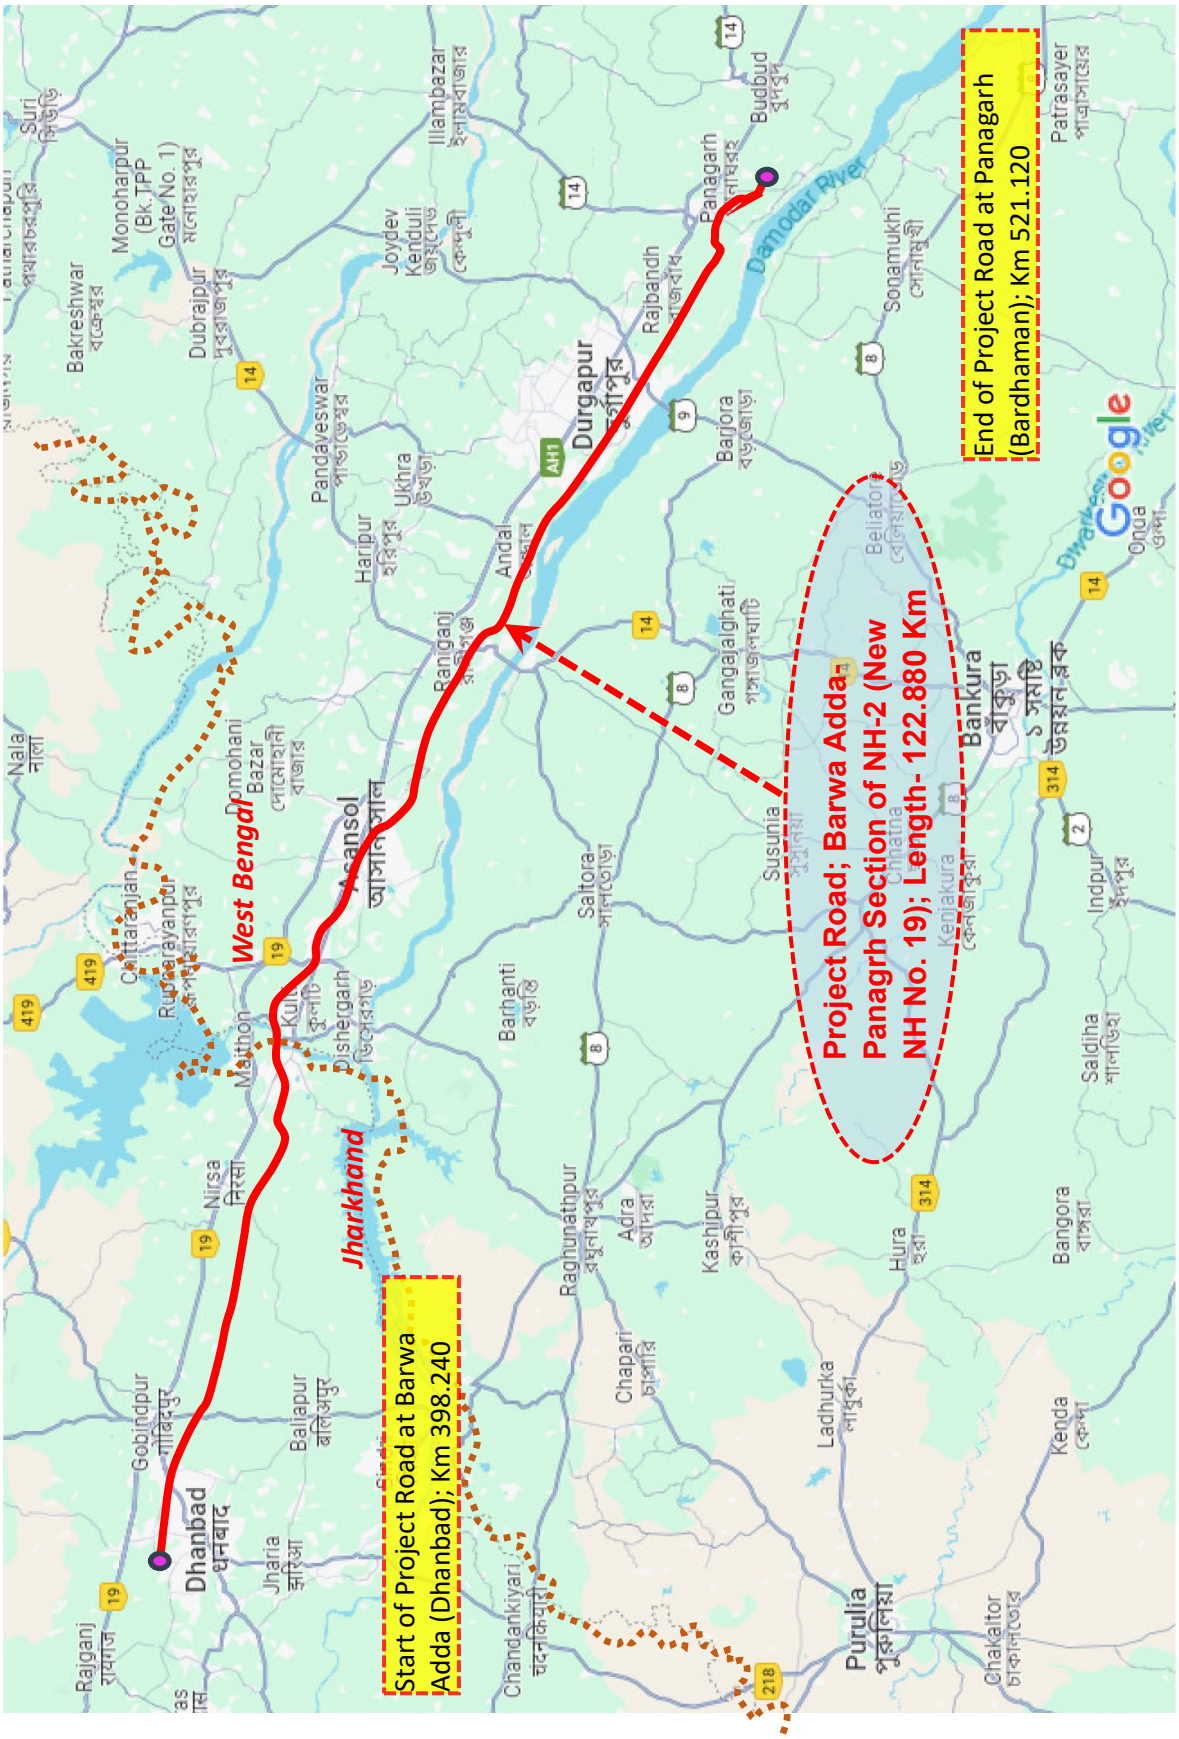

Figure 1-1 : Key Map

1.3 Key Findings

We have rated key findings with Red/Amber/Green for high risk, medium risk and low risk respectively.

🔴	**High Risk:** Critical risks that will have material impact on cost of project during balance concession period
🟡	**Medium Risk:** Moderate likelihood of impact on cost of project during balance concession period
🟢	**Low Risk:** Low level of impact on cost of project during balance concession period

Table 1-3 : Key Findings

Diligence Area	Findings	Risk
Balance Works	As per CA construction is to be completed by 26/09/2016. The majority of construction was completed in the year 2017. There are still some stretches where construction work is balance and currently in progress at site. Approx. in a length of 12.24km still construction is going on main carriageway including structure approach. Service road is under construction in a length of 6.495km and 19.035 km on LHS and RHS respectively. It is learned that due to slow progress of work exhibited by concessionaire balance work has not been completed yet. Anticipated completion date is 31.12.2023. Concessionaire has awarded the balance work to M/s S&P-Skylark and agreement made on 10thJune 2022	🔴
Operation and Maintenance	As per Article 17 of Concession Agreement, Concessionaire shall maintain project highway either by itself, or through the O & M Contractor. The concessionaire shall procure that at all time during the O & M period, the Project Highway conforms to the maintenance requirement set forth in Schedule-K. As per IE O & M Inspection Report, Concessionaire is advised to carryout day to day routine maintenance within given time frame.	🟡
Maintenance Manual and Yearly Program	As per Article 17.4 of Concession Agreement, Concessionaire required to submit proposed Program not later than 45 days before beginning of each accounting year.	🟢
Pavement Design	Pavement design was done as per IRC 37 – 2011 considering 8 % CBR. Key fact of pavement design is as follows: - Pavement design 13 years for BT layers and 20 years for Granular layers - Design Traffic varying from 31 to 70 MSA. - Total Traffic till year 2034 – 62 to 140 MSA Adopted Pavement thickness: BC – 50 mm, DBM - 50mm, AIL - 100mm, CTB - 75 to 105mm, CTSB – 250mm Pavement design for Service Road was designed for 10 MSA and accordingly following pavement thickness was adopted for Service Road. BC – 40 mm, AIL - 100mm, CTB - 100mm, CTSB – 250mm	🟢
Pavement Condition	As per Roughness survey report of May 2023 carried out by M/s SOWiL Limited, 92% length is in good to fair condition (roughness < 2500mm/km) and remaining 8% length is in poor condition As per our site observation, existing pavement condition is in Fair to Poor condition.	🟢

Diligence Area	Findings	Risk
Penalty	Penalty imposed / recommended by NHAI / IE. a) Rs. 5.24 Lakh recovery damage penalty imposed by IE for not repairing potholes on road. b) IE reported undue lane closure on Barakar bridge at Km 441 and recommended a penalty to be recovered by from concessionaire, Rs. 31. 82 Lakh in this regard c) IE reported undue lane closure on Garui ROB at Km 454 and recommended a penalty to be recovered by from concessionaire, Rs. 83. 04 Lakh in this regard d) Concessionaire has contested imposition of all penalties and attributes the reason of lane closure to authorities for their indecision on the issue Concessionaire is arguing all required action were taken by him under contract. Lanes were closed due to delay in instructions by authorities	
Change of Scope	NHAI issued COS notices to the Company Pursuant to Article 16 of the CA for following Items: - (A) Positive COS The COS proposals amounting to Rs. 111.55 cr was submitted to NHAI and are in various stages of approvals. Some of these COS are completed and some are in progress. (B) Negative COS 1. Negative COS towards Govindpur, Nirsa and Bograchotti – 119.46 cr 2. Negative impact towards O&M costs for de- scoped portion of Six-laning works – 11.99 cr 3. Negative impact towards De-scoping proposal of 6.852 km length of LHS service road held-up due to non-shifting of GEECL gas pipelines – 11.98 c Pending with NHAI	
Toll Plaza and TMS	There are two toll plazas along the project corridor at Km 438.500 (TP 1) having 5 + 5 lanes and Km 507.100 (TP 2) having 7 + 7 lanes. Rigid pavement has been provided at toll plazas. The existing Rigid Pavement at to both the Toll Plaza is in fair condition. The existing TMS system is in order and we do not envisaged any issue. The replacement of system is expected in Year 2028, 2033 and 2038.	
Major Issue Identified by IE	Current issue as per IE MPR oct 2023 is as follows: 1. MCW & Service Road construction progress is very slow due to lack of resources. 2. In Sep. 2023 balance work progress is approx. 0.35% (Total=84.65%). Remaining 15.35% to be completed in 03 months. So, Concessionaire has to be expediting the progress fast for completion of project up to 31.12.2023. 3. Safety in construction zone is not satisfactory. Diversion at km 433.550 is not satisfactory. NCR and Notice issued. 4. Condition of Road markings and road studs is poor and to be redone in entire length. 5. Routine Maintenance of Road Furniture (MBCB, Road Signs, kerb painting etc.)	
Road Safety	Road safety appurtenances in the form of sign board, blinker, road	

Diligence Area	Findings	Risk
	marking, lighting of highway, metal beam crash barrier etc. has provided as per Concession Agreement. As per site visit, following additional measures are recommended to enhance safety for road users: • Provide blinkers at all median • Provide missing median plant to reduce glare affect during night • Wrong placement of Sign Board • Provide PGR between MCW and SR at all locations • Antiglare arrangement at narrow median (width less than 2 m)	
Geometric Design	The project road is to be designed as per Specifications and Standards provided in Schedule D. Key parameters of design is as follows: Design Speed – 100 kmph, Minimum Radius 400 m as ruling and 250 m as absolute minimum, K value for Summit Curves 70 and Valley Curves 42 for Stopping Sight Distance. Project road confirms requirement of Schedule D.	●
As-Built Drawing	As per provision of Contract Sub Clause 12.3(a), the Concessionaire shall prepare and submit, with reasonable promptness and in such sequence as is consistent with the project completion schedule, three copies each of all drawing to the independent engineer to review.	●

1.4 Asset Condition

In general, the condition of asset is in Fair condition. As per consultants' study, with existing arrangement for Operation and Maintenance and with every 5 or 6 years cycle of Major Maintenance (Overlay) cycle, project road will continue to fulfill Level of Service as set forth in Schedule K and requirement of Article 17 of Concession Agreement except following improvements are required:

- Safety enhancement
- Roughness Survey and FWD Survey to be conducted as per frequency stated in Schedule L

The summary of asset condition is tabled as follow:

Table 1-4 : Asset Condition

Sl. No	Asset	Condition
1	Main Carriageway	Project road is 6 lane having paved width of 2 x 12.25 m at normal sections and 2 x 12.5 m at approach of grade separated structures. The pavement condition of existing pavement is generally in fair condition with isolated stretches of poor condition
2	Service Road	5.50 m & 7 m width of service road has provided at approach of Grade Separated Structures and at built up area. Total length of service road is 149.310 km including both sides. The pavement condition of service road is in fair condition. Also, routine maintenance of service road was found in poor condition. At some locations heavy commercial traffic is plying on the service road damaged pavement of service road as service roads are designed for 10 MSA only as per contract. These locations are after Raniganj towards Panagarh as majority of roads from Bihar and Northeast States join between this section. Approx. length of these sections is 21.65 km, and these stretches need immediate repair

Sl. No	Asset	Condition
3	Median	4.5/2.0 m raised median has been provided. Median plantation in rural areas (4.5 m width) is in order, trimming is required in entire stretch. NJCB has been provided at 2m wide median locations and is in fair condition.
5	Drainage arrangement	Lined drain has provided between Main Carriageway and Service Road/at outer edge of slip road and is in good condition.
6	Major and Minor Junctions	14 nos of major junctions and 40 nos of minor Junctions are found along project road.
7	Safety Barrier	Metal Beam Crash barrier has provided along outer edge and median side and RCC Crash barrier has provided over approach of GS Structure on top of RE Wall and is in good condition
8	Pedestrian Guard Rail	Pedestrian Guard Rail has provided in between MCW and SR at some built up area to guide pedestrian safely to crossroad at designated location. However, PGR has not provided at complete required length i.e. between MCW and SR. As per Inventory condition survey report 3670 m is found at site.
9	Toll Plaza	There are two toll plazas along the project corridor at Km 438.500 (TP 1) having 5 + 5 lanes and Km 507.100 (TP 2) having 7 + 7 lanes. Rigid pavement has been provided at toll plazas. The existing Rigid Pavement at to both the Toll Plaza is in fair condition. The existing TMS system is in order and we do not envisaged any issue. The replacement of system is expected in Year 2028, 2033 and 2038.
10	Highway Lighting	Highway lighting is provided at the Toll Plaza, approach of major Junction at median. 51 nos of High Mast have provided at Toll Plaza, Major Junctions and Flyovers. Existing condition of highway lighting is in order.
11	Bus Bays and Bus Shelters	40 nos of bus bays with shelter have observed at site and conditions.of bus bays and shelters are generally found to be in good condition. However, at 8 locations bus sheds are damaged and needs to be repaired.
12	Truck Lay byes	14 nos of truck laybys have been provided with facility of toilets and drinking water facilities and no major repairs are required at present.
13	Traffic Sign and Marking	292 nos. of Traffic Sign boards were observed during the inventory of project road. The condition of most sign boards was found to be Good except some of sign boards are required to be replaced with new. Road Marking was in poor condition.
14	Major Bridge	6 no of Major Bridge has provided and structural condition of bridge is fair to good. Drainage Spout cover and elastomeric strip seal is found to be defective which are required to be provided.
15	Minor Bridge	21 numbers of Minor Bridge are in fair to good condition. Maintenance / cleaning of Expansion Joint, drainage spouts and protection work are required.
16	PUP/SVUP/LVUP/ VUP	33 Nos, structurally in good condition.
17	ROB	6 nos of ROB having varying span arrangement and found to be in good condition.
18	Cross Drainage	Total 80 nos of cross drainage structures have found and condition of structure are found to be in order.

1.5 Requirement of O & M and Periodic Maintenance as per Concession Agreement

As per Schedule K, the Concessionaire shall take all such actions and do all such things (including without limitation, organizing itself, adopting measures and standards, executing procedures including inspection procedures, highway patrols and engaging contractors, if any, agents and

employees) in such manner, as well:

i) Ensure the safety of personnel deployed on and users of the project facilities or part thereof.
ii) Keep the Project Facilities from undue deterioration and wear
iii) Permit unimpaired performance of statutory duties and functions of any party in relation to

During the concession period, the Concessionaire is fully responsible for Operation & Maintenance of Project Highway. Schedule K elaborates requirement various service factor desirable level and acceptable level during O & M period along with time period if any parameter level of service beyond acceptable limit.

As per schedule K, no mention of periodic/structural overlay of pavement. However, there is a provision of repair/rectification if the roughness value exceeds 2500mm/km.

It is observed that traffic projections as per current traffic are higher than those taken at design time. Hence early strengthening of pavement may be required. The remaining life pavement in approx. 20 km on LHS and 27 km. on RHS is less than 2 years, these sections require immediate overlay. These sections have been proposed with structural overlay in the year 2024/25. Strengthening of pavement is worked out on the basis of FWD analysis and new projections of traffic loading. The same detailed out in relevant chapter of this report.

The anticipated balance MSA (2023-2038) to be served till end of concession period is 111 and 208 for section1 (Barwa adda-Raiganj) and section2 (Raiganj – Panagarh) respectively. The pavement design adopted during construction is for 62 and 140 MSA..

While estimating the maintenance requirements concession period up to year 2038 has been considered as per concessionaire letter BAEL/PRJ/TEC/ICO-581/2023/3943 dated 13th oct 2023.

1.6 Major Maintenance

Major Maintenance is required in order to comply requirement of Concession Agreement and to maintain performance level as defined in CA. MMR cycle has been done on the basis of point wise FWD analysis and roughness surveys. The basic principle considered in calculating overlay requirement is as under:

A. The traffic projections (MSA) are obtained from the combined results of axle load and historical traffic data as given in previous sections.

B. The project stretch is divided into 2 homogenous sections and all the parameters are listed for each section.

C. For the sections having poor riding quality or the remaining life is less than 2years, immediate overlay has been proposed as per design traffic in the year 2038.

D. Sections which satisfy both the functional parameters as well have a life more than 2 years life are considered for routine maintenance only.

E. As per schedule K, there is provision of repair/rectification if the roughness value exceeds 2500mm/km. Accordingly responsive overlay has been proposed as given in the table below:

Table 1-5 : Major Maintenance requirements for pavement

S.N.	Year	Treatment Proposed	
		LHS	RHS
a) Main Carriageway			
1	FY24/25/26	Overlay for the sections with poor riding quality and remaining life less than year 2025, length 20.40 km Only BC in 2.00 km and BC+DBM in	Overlay for the sections with poor riding quality and remaining life less than year 2025, length 27.28 km Only BC in 6.70 km and BC+DBM in 20.58

S.N.	Year	Treatment Proposed	
		LHS	**RHS**
		18.40 km	km
		Immediate Major Repairs Cost has been considered @ 9% in the Fy 2023-24, @ 15% in the FY 2024-25 and 76% in Fy 2025-26	
2	FY27/28/29	30mm BC Overlay – 0 % 40mm BC Overlay – 85 % Where structural overlay is provided with DBM+BC in the year 2024, no improvement is considered in this cycle	30mm BC Overlay – 0 % 40mm BC Overlay – 83 % Where structural overlay is provided with DBM+BC in the year 2024, no improvement is considered in the year 2027/28
		Functional + Structural overlay MCW+S/R in 1st periodic maintenance cost has been considered @ 25% on Fy 2026-27, @50% on Fy 2027-28 and 25% on Fy 2028-29	
3	FY32/33/34	30mm BC Overlay – 85 % 40mm BC Overlay – 15 %	30mm BC Overlay – 83 % 40mm BC Overlay – 17 %
		Functional + Structural overlay MCW+S/R in 2nd periodic maintenance cost has been considered @ 25% on Fy 2031-32, @50% on Fy 2032-33 and 25% on Fy 2033-34	
4	FY36/37/38	40 mm BC Overlay in entire stretch	40 mm BC Overlay in entire stretch
		Functional + Structural overlay MCW+S/R in 3rd periodic maintenance cost has been considered @ 25% on Fy 2035-36, @25% on Fy 2036-37 and 50% on Fy 2037-38	
b) Service Road			
1	FY24/25/26	30mm BC for the sections with poor riding quality, length 21.65km	30mm BC for the sections with poor riding quality, length 21.65km
2	FY27/28/29	30 mm BC overly on service road stretch excluding the under construction stretch 25.53 km & the stretch of service road undergone for immediate repair	
3	FY32/33/34	30 mm BC on 100 % length	30 mm BC on 100 % length
4	FY36/37/38	40 mm BC on 100 % length	40 mm BC on 100 % length
c) Structure Major Maintenance			
Replacement of Wearing Coat at every MM Cycle			

Table 1-6 : Major Maintenance Cost and periodic maintenance cost

Sl. N0.	Type of maintenance	Year	Base Cost excl. GST (year 2024) (Rs. In Cr.)	Subtotal of base cost (Rs. In Cr.)	Esc Period	Cost on due date @ 5% Escalation (Rs. In Cr.)	Subtotal of escalated cost (Rs. In Cr.)
1	Immediate Major Maintenance	2023/24	5.11	**56.80**	0	5.11	**61.65**
2		2024/25	8.52		1	8.95

12		2037/38	98.90		14	195.81	

1.7 Routine Maintenance

Routine Maintenance will mainly consist of the following costs.

- Cost of Routine repair and maintenance
- Cost of routine operation
- Cost of Tolling Operation
- Electrical work Cost
- Structure Maintenance Cost
- Transportation Cost
- TMS/HTMS costs and other
- SPV Costs

Cost of Routine Maintenance is shown in table below:

Table 1-7 : Routine Operational Cost (Annual)

Sl. No.	Description	Remarks	Amount (in CR) in FY 2023-24	Amount (in CR) FY 2024-25 onwards
1	R&R of Road works	Routine maintenance related to pavement repairs like pothole repairs, crack sealing, patch works, Replacement of road furniture, repair of kerb, kerb painting, sign boards repair, drain repair, shoulder repair, Road Marking repair, replacement of Safety Barriers etc.	1.63	3.26
2	R&R of Structure works	Maintenance related to bridges and structures at including bearing, replacement, expansion joint replacement, grouting, RE wall repair etc.	0.54	1.07
3	Incident Management (IM) Services & Route Operation	Includes IM staff: RPV- driver, RPO, helper; Ambulance- driver, paramedic, helper; Recovery Vehicle- driver, helper and Incident manager. Also includes: RPV/Ambulance/Recovery Vehicle- running, maintenance, rent etc, Diesels expenses	1.65	3.31
4	Toll Plaza	Includes outsourced manpower related to	4.99	9.98

SI. No.	Description	Remarks	Amount (in CR) in FY 2023-24	Amount (in CR) FY 2024-25 onwards
	Operation	toll collection - toll collectors, supervisors and associated expenses like uniform, printing rolls, food expense, accommodation etc.		
		O & M Cost in Crores	**8.81**	**17.62**

1.8 Conclusions

a) The project Road length is 125.380 Km and it is six lane divided Carriageway with Flexible Pavement.

b) The construction work in most of stretch is complete and the anticipated date of completion for balance works is 31-12-2023.

c) The concession period is 20 years i.e. up to 2034. However, as the present traffic is less than target traffic as per CA, concessionaire proposes for extension of concession period up to 2038.

d) Present tollable traffic is 27060 pcu at Beliyad toll plaza and 54320 pcu at Banskopa toll plaza. The growth rates of traffic is varying widely. For LCV growth is decreasing @ 5 to 6% and for buses increasing @ 0.59% to 3.79%. 2Axle truck traffic is increasing @ 3.3% at Beliyad toll plaza and decreasing @ 0.07% at Banskopa toll plaza. 3Axle trucks are decreasing by 4.5% to 8.9%. Multi axle traffic is in increasing trend with 2.1% at Beliyad plaza and 8.71% at Banskopa plaza. Considering this, 5% growth has been considered for MAV and 2% for other vehicles.

e) The Average granular layer thickness of existing pavement varies from 400 mm to 700 and bituminous layer thickness varies from 100 mm to 200 mm. As per Roughness survey report of May 2023 92% length is in good to fai2 condition (roughness < 2500mm/km) and remaining 8% length is in poor condition. As per visual observation, the existing pavement is in fair condition with isolated patches of Poor condition. Some maintenance work with patching were observed in different locations of the project corridor.

f) In the Project corridor, all the structures are in good condition. No major Maintenance is required.

g) The signboards are in good condition. Road markings and studs are in poor condition and need to be replaced most of the length. Solar blinkers were not provided at most of the median opening locations along the corridor. Few Blinkers are not in working condition.

h) The highway lightings are in working condition, but the LUX level is less than 40.

i) The remaining life pavement in approx. 20.4 km on LHS and 27.28 km on RHS is less than 2 years, these sections require immediate overlay. These sections have been proposed with structural overlay in the year FY 24/25/26. For other sections responsive overlay has been considered.

2 SURVEYS AND INVESTIGATIONS .

2.1 Objective and Scope of services

The main objective of undertaking surveys and investigations is to appreciate the existing engineering features along the project corridor and to understand the present condition of the various elements of the project road and to prepare inputs required for various rehabilitation and maintenance strategies. The present condition of the Project Highway has been assessed based on physical site visit observations and documents and test reports provided by the Client.

2.2 Sources of information & Documents reviewed

Following data/documents have been provided by the client which have been reviewed and considered for assessment of O&M requirement and major maintenance requirement for the project road;

a) Signed Concession Agreement including Technical Schedules;
b) Past O&M Reports (Concessionaire/IE reports)
c) Past roughness test report/results
d) Past FWD test report/results
e) Past NSV survey report/results
f) Past Due Diligence Reports
g) Past MPR & Inspection Reports
h) Traffic survey report
i) Past Report on ongoing or completed major maintenance

2.3 Surveys & Investigations

Following Survey and Investigations have been undertaken as a part of study with an objective to understand the present condition of the road and there by access the quality of construction and as well to prepare requisite rehabilitation/corrective designs where necessary.

- Road Inventory/Asset Inventory Surveys
- Visual Pavement & Structural Condition Surveys
- Collection of pavement crust data by trial pits @ every 15 km interval
- Axle load survey at two locations for the assessment of axle loading pattern and estimation of VDF. (48 Hrs. at each location)
- Under Construction Stretches of Project Road
- Road Marking & Traffic Signages

2.3.1 Road Inventory

The project corridor has Flexible pavement in the entire length, with 10.50m wide carriageway flanked by 1.5m paved shoulder and 2.0 m earthen shoulder on each side.

In general, the median is raised median of width varying between 1.5 to 4.0m all along the project road.

The project corridor generally runs in plain and rolling terrain. The land use along the project road is mostly Agricultural interspersed with urban settlements. Govindpur, Nirsa, Raniganj, Asansol, Durgapur and Panagarh are major built-up area through which the project road traverses.

In general, road embankments are in the range of 1.5m to 2.5m height. Embankments higher than 2.5m are observed mainly in the approaches of CD structures and Underpass locations.

There is total 149.310 km of service road (including both sides) at built up and other sections. Service road between Km. 466.780 to Km. 467.640 is in very poor condition and needs immediate attention for repair/reconstruction. Also, the stretch between Km. 428.040 to Km. 428.400 has temporary service road which also needs to be constructed.

The Project Road has about 48 nos. of major and minor junctions along its length.

There are 21 nos. of minor bridges and 6 nos. of major bridges along the entire project stretch.

There are 6 nos. of RoB's along the entire project stretch.

There is total 10 nos. of grade separated structures (flyovers), 21 nos. of VUP's, 02 nos. of VOP's, and 10 nos. of PUP/CUP along the entire project stretch.

There are two toll plazas in project stretch. One at km.438+500 at Maithon and second at km.507+085 at Banskopa. Both the Toll plazas are fully operational. Toll plaza control centre is located at Ch. 507+085.

2.3.2 Visual Pavement Condition Surveys

The Pavement condition Survey has been conducted by visual observation. The Condition survey has been conducted for each km length in each direction. By visual inspection the pavement condition appears to be fair and riding quality is satisfactory in most of the stretches. Stretches with major pavement distress are presented in the table below;

Table 2-1 : Detail of Distresses in existing pavement

S. No.	Start Chainage	End Chainage	Length(m)	Distress
1	411+700	411+800	100	Cracking on LHS C/W
2	414+000	414+250	250	Cracking on RHS C/W
3	432+900	433+000	100	Cracking with Ravelling and Rutting
4	434+240	434+260	20	Cracking with Potholes
5	442+920	442+980	60	Patching on LHS C/W
6	451+260	451+360	100	Cracking on RHS C/W
7	449+900	449+950	50	Cracking on LHS C/W and Potholes on RHS C/W
8	451+100	451+240	140	Cracking on LHS C/W
9	464+600	464+700	100	Cracking with Ravelling and Rutting
10	466+020	466+140	120	Cracking on LHS C/W
11	508+110	508+160	50	Patching on LHS C/W
12	508+300	508+500	200	Cracking with Ravelling and Rutting
13	518+750	518+800	50	Cracking on LHS C/W

2.3.3 Condition Surveys of Structures

Most of the structures appear to be in fair to good condition as inspected by visual observation. Minor repair works like repairing/replacement of wearing coat, clearing of drainage spouts, repair of expansion joints, cleaning of water way/vent etc. is required for most of the structures.

The detail of structure conditions and requirement of repair works is presented below in tabular form;

Table 2-2 : Condition & Proposed Repair Works of Structures

Sl. No.	Chainage (Km)	Type of Structure	Span Arrangement	Remarks	Condition of Structure	Repair/Rehabilitation Works Required
1	398+495	PUP/ CUP	1x7.0	Construction work is still under progress	-	-

2.3.4 Pavement Crust

Pavement crust data has been collected by digging trial pits at the road edge and measurement of various pavement layers by steel tape/scale. The trial pits were dug at every 15km interval on either side of carriageway. The result of pavement crust data is presented in the below table;

Table 2-3 : Detail of existing pavement crust

Trial Pit at km 414 (LHS)

33	508+000	508+500	500	LHS Under Construction
	Total Length (in Meter)		**17440**	

Lined drain repairing/construction work is also under progress at following stretches of project road;

Table 2-7 : Detail of Lined Drain repairing/construction work

S. No.	Start Chainage	End Chainage	Length(m)	Remarks
1	401+400	402+000	600	U/C on LHS
2	406+900	407+300	400	U/C on LHS
3	408+250	409+000	750	U/C on LHS
Total			**1750**	

2.3.7 Road Marking & Signages

Road marking appears to be in fair condition in almost entire stretch except the stretches where construction work is under progress and structure locations along with approaches where the road markings are either not available or in poor condition and needs to be rectified immediately.

Road studs are not adequate/functional in almost entire stretch of project road. Road delineators are also not found along the project road.

Most of the signages are found to be in order, however few signages are not found along the project road as mentioned below and the same needs to be placed considering the safety of the road users;

The details of major road marking and signages which needs to be rectified are presented below;

Table 2-8 : Detail of Road Markings and Signages to be rectified

S. No.	Type of Signages/ Road Markings	Requirement
1	Road Markings i.e., CL, edge marking	Road markings to be rectified at required locations especially at structure locations along with approaches
2	Road Studs	Road studs to be replaced/rectified at required locations along the entire stretch of project road
3	Delineators	Road delineators to be installed at required locations along the entire stretch of project road
4	Gap In Median	Required in entire project stretch at Median Opening Locations
5	U Turn Ahead	Required in entire project stretch at U Turn Location
6	LHS Object Hazard Marker	Required in entire project stretch at Object Hazard Locations

3 PAVEMENT EVALUATION AND OVERLAY DESIGN

3.1 Background

Pavement is an integral part of all highway projects. Pavement performance under prevailing as well as projected traffic and environmental conditions is considered to be crucial as it has a direct bearing on the economic returns from the project developments. An under-designed pavement will fail prematurely, resulting in the additional cost to the project. Hence it is necessary to ensure the pavement layer thicknesses, configurations and materials are adequately designed and require minimal maintenance under the anticipated traffic loading throughout the project life. To achieve this objective and thereby to predict the performance of any pavement structure, it is necessary to analyze material characteristics, traffic condition, present physical condition of the pavement layers, local environment and its impacts, probable modes of failure of existing pavement and technology available for reconstruction. In addition, it is also necessary to presume what level of performance and what pavement condition will be considered satisfactory in order to estimate the future operation and maintenance cost of the road. Due to the large number of variables involved, it is intricate task to determine exact level of pavement performance through the project life. But, based on the assessment of present condition of pavement, analysis of available survey data, traffic projections and estimations regarding the pavement life, future maintenance requirements can be estimated.

The present chapter contains the details about the series of field investigations and analysis carried out to find out the present condition of pavement as well as to determine the future maintenance requirements for sound pavement performance throughout the project life.

Objectives

- To assess the present physical and structural conditions of pavement layers.
- To formulate the rehabilitation/rectification proposal as required for damaged/poor sections.
- To determine the future maintenance requirement for sound performance (both structural and functional) of pavement layers throughout the concession period.

3.2 Pavement Crust adopted during construction of six lane

During construction of six laning, project road was divided into 5 homogeneous sections, and pavement design has been carried out based on design MSA of respective homogeneous sections. Pavement design was carried out considering stage construction with 13yrs design life for bituminous layers and 20 years design life for granular layers. Summary of MSA and crust adopted is given below:

HST-1 Barwa Adda– Dhanbad Junction
HST-2 Dhanbad Junction- Asansol
HST-3 Asansol- Raniganj
HST-4 Raniganj- Durgapur
HST-5 Durgapur – Panagarh

Table 3-1 : Summary of MSA and adopted crust by the concessionaire

Homogenous Section	Chainage		Length (KM)	For Bituminous Layers		For Granular Layers	
	From	To		Design period	MSA	Design period	MSA
HST-1	398.240	408.500	10.260	13 yrs (2027)	31	20 yrs (2034)	62
HST-2	408.500	447.750	39.250	13 yrs (2027)	29	20 yrs (2034)	58
HST-3	447.750	464.400	16.650	13 yrs (2027)	34	20 yrs (2034)	67
HST-4	464.400	496.600	32.200	13 yrs (2027)	56	20 yrs (2034)	112
HST-5	496.600	521.120	24.520	13 yrs (2027)	70	20 yrs (2034)	140

Section	Chainage		Length (KM)	Crust for New Sections	Crust for Widening Sections
	From	To			
HST-1	398.240	408.500	10.260	BC - 50, DBM - 50, AIL - 100, CTB - 75, CTSB-250	BC - 40, DBM - 50, WMM - 250, GSB - 550
HST-2	408.500	447.750	39.250	BC - 50, DBM - 50, AIL - 100, CTB - 80, CTSB-250	BC - 50, DBM - 50, WMM - 250, GSB - 550
HST-3	447.750	464.400	16.650	BC - 50, DBM - 50, AIL - 100, CTB - 85, CTSB-250	BC - 40, DBM - 60, WMM - 250, GSB - 550
HST-4	464.400	496.600	32.200	BC - 50, DBM - 50, AIL - 100, CTB - 100, CTSB-250	BC - 40, DBM - 95, WMM - 250, GSB - 550
HST-5	496.600	521.120	24.520	BC - 50, DBM - 50, AIL - 100, CTB - 105, CTSB-250	BC - 40, DBM - 100, WMM - 250, GSB - 550

It can be observed that from Barwa adda to Raniganj (HST-1 to HST-3) traffic loading is almost similar but it increases substantially in the section after Raniganj (HST-4 to HST-5). This is due to the fact that Kolkata / Durgapur bound traffic from Bihar and Northeast states join project road between Raniganj and Panagarh.

3.3 Survey and Investigations

Following site investigations and surveys were carried out/referred to determine the present condition of pavement as well as to find out the future maintenance requirements.

i. Traffic Surveys – Data provided by client.
ii. Axle Load Surveys
iii. Roughness Survey– Data provided by client.
iv. Pavement Condition Surveys
v. Falling Weight Deflectometer (FWD) Test– Data provided by client.

3.4 Traffic Surveys & Analysis

The summary of past traffic data at both toll plazas for the years from 2014 to 2023 as provided by the client is given below and the details are given in Appendix 1.

Table 3-2 : Past Traffic Data

Year	Beliyad					Banskopa				
	LCV/ Mbus	Bus	2A Truck	3A Truck	MA Truck	LCV/Mini bus	Bus	2A Truck	3A Truck	MA Truck
2014	660	412	570	2540	961					
2015	678	223	436	2319	1717					
2016	478	210	581	1696	1885					
2017	457	260	681	1816	2584	1133	486	2186	2944	2865
2018	404	245	795	1917	3085	1245	908	2139	3154	3528
2019	402	249	775	1744	2961	1161	860	1882	2758	3662
2020	321	219	702	1573	3029	938	649	1966	3253	4095
2021	284	242	858	1441	3660	848	824	2054	2466	4872
2022	292	306	966	1091	3495	841	940	2130	2393	5822
2023	265	286	1033	997	3454	753	871	2107	2124	6221
CAGR	**-5.4%**	**3.79%**	**3.30%**	**-8.9%**	**2.10%**	**-6.33%**	**0.59%**	**-0.07%**	**-4.5%**	**8.71%**

As can be seen from the above data, the growth rates of traffic is varying widely. For LCV growth is decreasing @ 5 to 6% and for buses increasing @ 0.59% to 3.79%. 2Axle truck traffic is increasing

@ 3.3% at Beliyad toll plaza and decreasing @ 0.07% at Banskopa toll plaza. 3Axle trucks are decreasing by 4.5% to 8.9%. Multi axle traffic is in increasing trend with 2.1% at Beliyad plaza and 8.71% at Banskopa plaza.

Present tollable traffic is 27060 pcu at Beliyad toll plaza and 54320 pcu at Banskopa toll plaza.

On analyzing the above data and experience of consultants in similar projects, the following growth rates have been adopted for estimating the future traffic loading on the project road.

Table 3-3 : Adopted Traffic Growth Rates

Period	LCV/Minibus	Bus	2A Truck	3A Truck	MA Truck
2024-2027	2.00%	2.19%	2.00%	2.00%	5.40%
2028-2038	2.00%	2.00%	2.00%	2.00%	5.00%

3.5 Axle load survey data & analysis

The axle load survey was conducted using portable weighing pads for 48 Hrs at both the toll plazas from 21-11-2023 to 24-11-2023. The survey was conducted in both directions with random selection of vehicles for axle load measurement, ensuring a suitable sample for each category of commercial vehicle including empty vehicles.

Due to the mixed traffic condition of the project highway, the traffic load is heterogeneous in nature. In order to know the actual impact of heterogeneous traffic load on highway pavement it is essential to convert the heterogeneous traffic to equivalent homogenous traffic. Equivalent Standard Axle Load (ESAL) is a parameter used to express the heterogeneous traffic load in terms of a standard axle load of 80KN and VDF is the multiplying factor used to convert the traffic loads of different type of vehicle into the equivalent number of standard axle loads.

Equations as given in section 4.4, IRC: 37-2018, have been used for computing equivalency factors for converting different axle load repetitions into equivalent standards axle load repetitions (ESAL). In order to convert the ESAL into VDF, the frequency distribution of ESAL for each category of vehicle and weighted average of ESAL is calculated to arrive at the VDF. Detailed calculations are given in **Appendix 2.1 & 2.2** and summary is presented below:

Table 3-4 : Vehicle Damage Factor

Type of Vehicle	Sample (%)	Panagarh - Dhanbad		Dhanbad - Panagarh		Adopted VDF
		No. of Veh.	VDF	No. of Veh.	VDF	
@ Beliyad toll plaza (Ch. 438+500)						
LCV	57.4%	73	1.34	79	1.49	1.40
2A Truck	19.0%	86	3.21	110	2.51	2.90
3A Truck	30.2%	162	5.61	139	6.49	6.00
MA Truck	23.4%	383	8.48	424	11.52	10.00
Bus	20.6%	45	1.89	14	1.54	1.70
@ Banskopa toll plaza (Ch. 507+100)						
LCV	19.8%	63	0.66	86	1.05	0.90
2A Truck	14.8%	182	2.97	130	1.94	2.50
3A Truck	17.7%	216	4.92	159	5.28	5.10
MA Truck	12.1%	418	10.84	337	11.86	10.50
Bus	4.9%	21	1.80	22	1.23	1.50

3.6 Design Traffic Loading

With the above base year traffic, growth rates and VDF, future traffic loading in terms of MSA has been worked out which comes to following.

Table 3-5 : Design Traffic Loading (MSA)

Design Year	Beliyad toll plaza (Ch. 438+500)	Banskopa toll plaza (Ch. 507+100)
	Ch 398.240 to 464.400	Ch. 464.400 to 521.120
2028	MSA 33	MSA 62
2033	MSA 68	MSA 127
2038	MSA 111	MSA 208

Table 3-6 : Cumulative million standard axles (MSA) at Ch. 438+500

3.7 Roughness survey using NSV

Roughness is one of the important parameters for determining the functional characteristics of pavements. Roughness Survey was performed by NSV using the Laser Profilometer by M/s SOWiL Limited in the month of May 2023. Based on the Roughness value, The riding quality of project road is summarized in the table below as per IRC:SP:16-2019

Table 3-8 : Summary of Pavement Riding Quality as per NSV surveys

Riding Condition	Roughness Index (mm/KM)	Length (in km)		% Length	
		LHS	RHS	LHS	RHS
Good	< 1800	90	86	73%	70%
Fair	1800 - 2500	27	27	22%	22%
Poor	>2500	7	10	5%	8%

It is observed that roughness index was similar in both directions. The Roughness Index at some locations for LHS and RHS lane was beyond limit of 2500 mm/km. The major section of the project road has roughness index less than 2500 mm/km and has fair riding quality. Locations having roughness index in excess of 2500mm/ km are proposed for immediate improvement of riding quality.

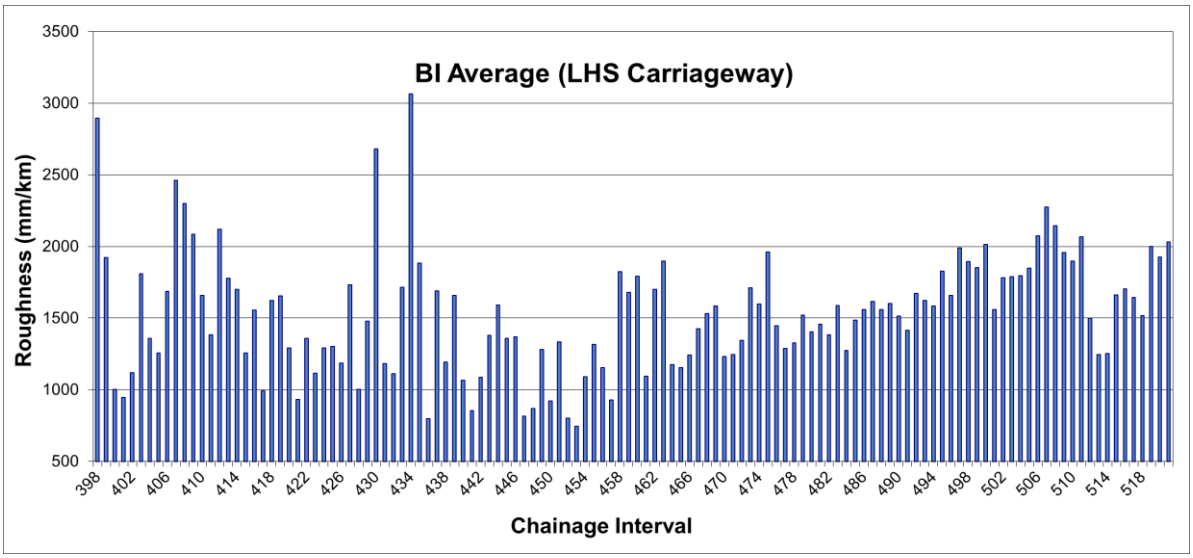

Figure 3-1 : BI Average for LHS Carriageway (Barwa Adda - Panagarh)

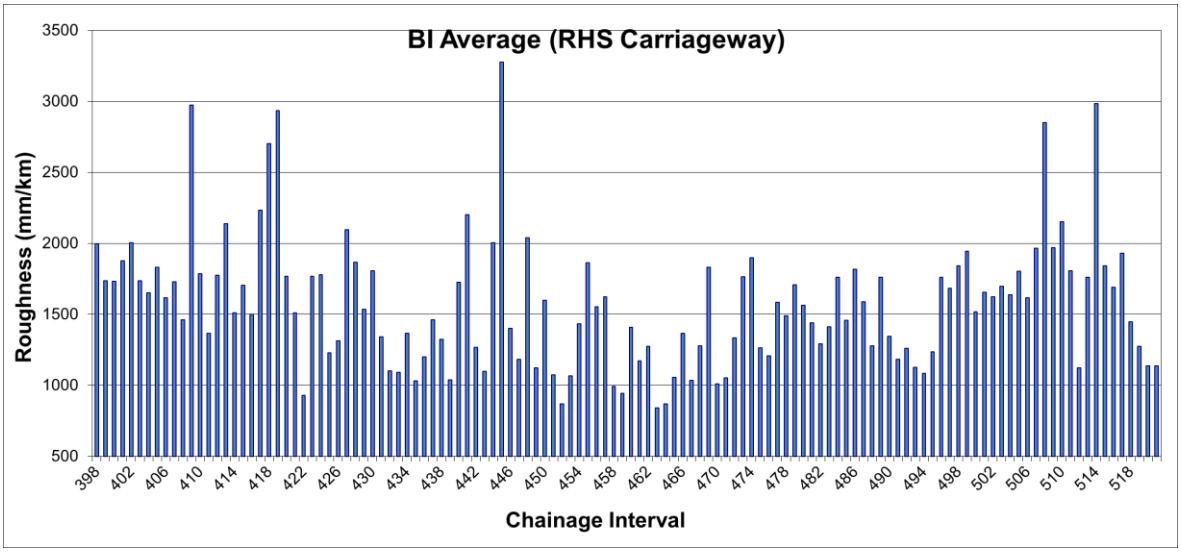

Figure 3-2 : BI Average for RHS Carriageway (Panagarh - Barwa Adda)

3.8 Existing Pavement Composition

Existing pavement composition (pavement course, material type, and thickness) was recorded at an interval of 10.0 km along the Project Stretch. The pavement composition was checked to understand the construction layers laid on the project road and its correlation and analysis of residual life and strengthening requirement. The Average granular layer thickness varies from 400 mm to 700 and bituminous layer thickness varies from 100 mm to 200 mm. The summary of existing pavement crust thickness is presented in the following table:

Table 3-9 : Existing Pavement Composition

S.No	Location (km)	Test pit side	Surface Layer		Granular Layer

3.9 FWD Analysis and Assessment of Overlay requirement

A Falling Weight Deflectometer (FWD) is used to measure the vertical deflection response of a surface to an impulse load. Precision load measurement and deflection sensors record the pavement surface characteristics, which is used to calculate pavement properties such as bearing capacity, elastic modulus and expected surface life.

Concessionaire has conducted FWD for entire Project Road. Summary of remaining life of existing pavement as per the FWD Test results provided by the client is presented below and the detail data and calculations as provided by the Concessionaire.

	From	To	Bituminous Layer	Granular layer	Subgrade	Bituminous Layer	Granular layer	Subgrade
123	520	521	1854	389	87	3724	392	87
124	521	522	1305	270	87	2540	346	86

It can be noticed from the above table that the layer moduli for the three layers vary along the length and direction. The MR value for BT layer varies between 790 Mpa to 4326 Mpa in LHS & 992 Mpa to 5005 Mpa in RHS Carriageway. The MR value for Granular Layers varies between 95 Mpa to 396 Mpa in LHS & 143 Mpa to 396 Mpa in RHS Carriageway. Similarly, the MR value for Subgrade Layer is 86 Mpa to 87 Mpa in both directions.

The MR value for BT layers is moderated and considered as 3000 Mpa where it is more than 3000 Mpa as suggested upper limit in IRC 115 is 3000Mpa.

3.10 Remaining life of existing pavement

The remaining life of existing pavement has been calculated with the 15th percentile back-calculated corrected layer moduli and layer thicknesses given in above sections. The critical strains have been calculated with IITPAVE program considering existing road as three-layer pavement system. With the strains obtained from IITPAVE, remaining life of pavement has been estimated using Fatigue and Rutting criteria mentioned in IRC – 115:2014 and in IRC-37:2018. The following table gives details of the remaining life of existing pavement.

Table 3-11 : Remaining life of Existing Pavement

LHS Carriageway

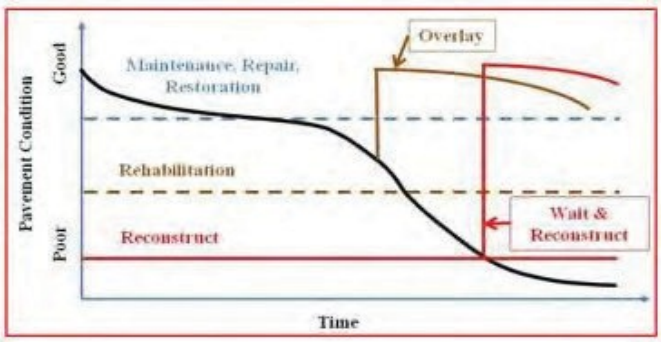
3.11 Determination of Pavement Major Maintenance

The performance of a pavement is affected by the type, time of application, quality of the maintenance it receives. Preventive maintenance slows the rate of pavement deterioration due to traffic and environmentally applied loads. Delays in maintenance and deferred maintenance increase the quantity of defects and their severity so that, when corrected, the cost of repair is greater as shown in figure below:



Major Maintenance is required in order to comply requirement of Concession Agreement and to maintain performance level as defined in CA. MMR cycle has been done on the basis of point wise FWD analysis and roughness surveys. The basic principle considered in calculating overlay requirement is as under:

F. The traffic projections (MSA) are obtained from the combined results of axle load and historical traffic data as given in previous sections.

G. The project stretch is divided into 2 homogenous sections and all the parameters are listed for each section.

H. For the sections having poor riding quality or the remaining life is less than year 2028 (< 4years), immediate overlay has been proposed as per design traffic in the year 2038.

I. Sections which satisfy both the functional parameters as well have a life more than 4 years life are considered for routine maintenance only.

J. As per schedule K, there is provision of repair/rectification if the roughness value exceeds 2500mm/km. Accordingly responsive overlay has been proposes as given in the table below:

Table 3-12 : Major Maintenance requirements for pavement

S.N.	Year	Treatment Proposed	
		LHS	**RHS**
a) Main Carriageway			
1	FY24/25/26	Overlay for the sections with poor riding quality and remaining life less than year 2025, length 20.40 km Only BC in 2.00 km and BC+DBM in 18.40 km	Overlay for the sections with poor riding quality and remaining life less than year 2025, length 27.28 km Only BC in 6.70 km and BC+DBM in 20.58 km
		Immediate Major Repairs Cost has been considered @ 9% in the Fy 2023-24, @ 15% in the FY 2024-25 and 76% in Fy 2025-26	
2	FY27/28/29	30mm BC Overlay – 0 % 40mm BC Overlay – 85 % Where structural overlay is provided with DBM+BC in the year 2024, no improvement is considered in this cycle	30mm BC Overlay – 0 % 40mm BC Overlay – 83 % Where structural overlay is provided with DBM+BC in the year 2024, no improvement is considered in the year 2027/28
		Functional + Structural overlay MCW+S/R in 1st periodic maintenance cost has been considered @ 25% on Fy 2026-27, @50% on Fy 2027-28 and 25% on Fy 2028-29	
3	FY32/33/34	30mm BC Overlay – 85 % 40mm BC Overlay – 15 %	30mm BC Overlay – 83 % 40mm BC Overlay – 17 %

S.N.	Year	Treatment Proposed	
		LHS	RHS
		Functional + Structural overlay MCW+S/R in 2nd periodic maintenance cost has been considered @ 25% on Fy 2031-32, @50% on Fy 2032-33 and 25% on Fy 2033-34	
4	FY36/37/38	40 mm BC Overlay in entire stretch	40 mm BC Overlay in entire stretch
		Functional + Structural overlay MCW+S/R in 3rd periodic maintenance cost has been considered @ 25% on Fy 2035-36, @25% on Fy 2036-37 and 50% on Fy 2037-38	
b) Service Road			
1	FY24/25/26	30mm BC for the sections with poor riding quality, length 21.65km	30mm BC for the sections with poor riding quality, length 21.65km
2	FY27/28/29	30 mm BC overly on service road stretch excluding the under construction stretch 25.53 km & the stretch of service road undergone for immediate repair	
3	FY32/33/34	30 mm BC on 100 % length	30 mm BC on 100 % length
4	FY36/37/38	40 mm BC on 100 % length	40 mm BC on 100 % length
c) Structure Major Maintenance			
Replacement of Wearing Coat at every MM Cycle			

Detailed maintenance schedule for each section is presented in in subsequent sections.

4 OPERATION & MAINTENANCE COST

4.1 General

Cost Component for various items and activities have been worked out by considering the Best Industry practice and most appropriate methods. The gist of the cost components considered are presented below:

A. Immediate Repair's Cost

B. Periodic Maintenance Cost

- Functional +Structural overlay on MCW& SR
- Major Maintenance of Rigid Pavement
- Replacement of wearing coat at every MM cycle
- Replacement of Toll Hardware and software & HTMS at later date

C. Routine Maintenance Cost

- Routine Maintenance of Road
- Routine Maintenance for Structures
- Route Operation
- Toll Plaza Operation
- Highway Patrolling % Incident management
- Operation and management costs of rest areas and lay byes
- Maintenance of utilities and public amenities

D. Toll Plaza Operation cost - Toll collections, toll plaza maintenance, security, tools and equipment, software, hardware, surveillance etc.

4.2 Item Rates

Unit rates considered along with source/assumptions is given in the table below:

Table 4-1 : Item Rates

Item No	Description	Unit	Rate	Remarks
1	**Immediate Major Maintenance**			
A	**Highways**			
1.01	Tack coat over bituminous surface	Sqm	8.00	BoQ of ongoing MMR
1.02	DBM	Cum	8,179.00	BoQ of ongoing MMR
1.03	BC	Cum	10,136.00	BoQ of ongoing MMR
B	**Structure**			
1.04	removal of wearing coat	Sqm	320.00	1 labor per day per sqm
1.05	New wearing cost	Sqm	970.45	Balance work BoQ
1.06	replace expansion joint	m	13,204.60	Balance work BoQ
1.07	cleaning Drainage spout	m	250.00	1 labour can clean 2 drainage spout in a day i/c tool and plant
1.08	replace Crash barrier	m	6,360.15	Balance work BoQ
1.09	replace RCC Railing	m	6,287.91	Balance work BoQ
1.10	Repair of spalling of concrete	sqm	500.00	1 sqm consumes 0.1 cum of concrete and cost of concrete is Rs. 5000 per cum
2	**Periodic maintenance**			

Item No	Description	Unit	Rate	Remarks
i	Functional + Structure overlay MCW+SR			
2.01	Tack coat over bituminous surface	Sqm	8.00	BoQ of ongoing MMR
2.02	BC	Cum	10,136.00	BoQ of ongoing MMR
ii	Major Maintenance of Rigid Pavement			
2.03	Panel Replacement - PQC	Cum	7,293.02	Balance work BoQ
2.04	Repair of cracks in rigid pavement	sqm	250.00	
2.05	Retexturing	Sqm	150.00	
iii	Structure			
2.06	removal of wearing coat	Sqm	320.00	1 labor per day per sqm
2.07	New wearing cost	Sqm	970.45	Balance work BoQ
2.08	replace expansion joint	m	13,204.60	Balance work BoQ
2.09	cleaning Drainage spout	m	250.00	1 labour can clean 2 drainage spout in a day i/c tool and plant
2.10	replace Crash barrier	m	6,360.15	Balance work BoQ
2.11	replace RCC Railing	m	6,287.91	Balance work BoQ
iv	Replacement of ATMS & TMS			
2.12	Replacement of ATMS & TMS	no.	1,20,00,000.00	
3.00	**Routine Maintenance**			
i	Repair and rehabilitation of Highways			
3.01	Pavement Cleaning/sweeping	Sqm	2.50	one labour can clean 128 sqm in one day.
3.02	Cleaning of Toll Plaza	Nos	1,44,000.00	
3.03	Cleaning of ROW	Hectare	7,500.00	
3.04	Pavement Cleaning/sweeping	Sqm	2.50	one labour can clean 128 sqm in one day.
3.05	Repair of cracks in rigid pavement	sqm	250.00	
ii	Service road			
3.06	Pavement Cleaning/sweeping	Sqm	2.50	one labour can clean 128 sqm in one day.
iii	Plantation			
3.07	Maintenace of Median Plantation / Trimming etc	km	10,000.00	assuming 30 nos of laboour in one kilometer
3.08	Watering at median Plantaion and Avenue Plantation	km	45,000.00	
3.09	Replacement of Median Plantation	Km	25,000.00	
3.10	Avenue Plantation	Nos	377.27	Balance work BoQ
iv	Protection works			
3.11	Cleaning of vegetation in shoulder on either side and side at side slopes (ROW Cleaning)	ha	48,000.00	
v	Busbay and Bus shelters			
3.12	Genereal Cleaning and Maintenance of Bus Shelter & Bus bay	Nos	5,000.00	
vi	Miscellaneous Item			

Item No	Description	Unit	Rate	Remarks
3.13	Carrying out routine maintenance to all types of road signs by regular washing , removal of pasted posters etc. complete as directed by the Engineer	Km.	1,500.00	
3.14	Maintenance of Laboratory	Month	50,000.00	
3.15	Cleaning of Drain	km	12,000.00	
3.16	Cleaning of Chute Drain	km	6,600.00	
3.17	Truck Layby Maintenance	m	2,12,680.00	
3.18	Safety Items at Site & Corridor	Per Plaza	5,00,000.00	
3.19	Rectification of damages at Site office (Civil Work)	Per Plaza	3,00,000.00	
vii	Structure			
3.20	General Cleaning of Structures - Removing of dirt, removing of vegetation and clearing the vent by all means for smooth flow	Sqm	400.00	
3.21	New wearing cost	Sqm	970.45	Balance work BoQ
3.22	replace expansion joint	m	13,204.60	Balance work BoQ
3.23	Drainage spout	no.	3,393.53	Balance work BoQ
3.24	RCC crash barrier	m	6,360.15	Balance work BoQ
3.25	bearing	no.	95,000.00	
4.00	**Route Operation**			
4.01	Driver	Nos, year	3,00,000.00	
4.02	Helper	Nos, year	2,40,000.00	
4.03	Route Patrol Officer/ Paramedical officer	Nos, year	3,60,000.00	
4.04	Monthly Hire Charge of Vehicle excluding Disel	Month	40,000.00	
4.05	Monthly Hire Charge of Vehicle excluding Disel	Month	60,000.00	
4.06	Diesel Cost	Ltr	90.00	
4.07	Safety Equipment	Month	5,000.00	
4.08	Tools - Chains etc	Month	2,500.00	
4.20	Manager - Corridor Control	Nos	7,20,000	
4.21	CRO	Nos	3,00,000	
4.22	Safety & Corridor Manager	0	9,00,000	
4.23	Vehicle for NHAI	Month	1,00,000	
4.24	Vehicle for Concessionaire PM	Month	1,00,000	
4.25	Vehicle for Route Operation Head	Month	1,00,000	
4.26	Vehicle for dead animal recovery	Month	1,20,000	
5.00	**Tolling Operations**			
5.01	Plaza Manager	Per Month	1,50,000	
5.02	Plaza Controller/Incharge	Per Month	75,000	
5.03	Asst. Plaza Manager	Per Month	50,000	
5.04	Route Officer	Per Month	30,000	
5.05	Toll Supervisor	Per Month	30,000	

Item No	Description	Unit	Rate	Remarks
5.06	Shift In charge	Per Month	30,000	
5.07	Cashier	Per Month	20,000	
5.08	Lane Supervisor	Per Month	20,000	
5.09	Admin/ Account Officer	Per Month	25,000	
5.10	Auditor	Per Month	20,000	
5.11	Exe.Point of Sale	Per Month	20,000	
5.12	Civil/Site Supervisor	Per Month	25,000	
5.13	Control Room Officer - HTMS	Per Month	25,000	
5.14	Toll Collector	Per Month	20,000	
5.15	Booth Assistant/ Lane Attendant	Per Month	20,000	
5.16	Route Patrolling Officer	Per Month	25,000	
5.17	Route Patrolling Assistant	Per Month	20,000	
5.18	Electrician and Helper	Per Month	20,000	
5.19	Office Support staff	Per Month	20,000	
5.20	Guest House	Per Month	20,000	
5.21	Security Supervisor	Per Month	25,000	
5.22	Security Guard	Per Month	20,000	
5.23	Gun Man	Per Month	20,000	
5.24	System Engineer	Per Month	25,000	
5.25	Labour	Per Month	15,000	
5.26	Miscellaneous	Per Month	2,00,000	
5.27	TMS	Per Month	2,50,000	
5.28	ATMS	Per Month	3,00,000	
5.29	Telecommunication Cost	Per Month	20,000	
5.30	Electricity	Per Month	50,000	

4.3 Costing

Cost of such regular and periodic maintenance is worked out and given in subsequent sections.

APPENDIX 1 - Past traffic data

APPENDIX 2 - Axle load survey data

Barwa – Adda - Panagarh Section of NH-2 from Km 398.240 to Km 521.120

CHAPTER 1
INTRODUCTION

1.1 General

Thiruvananthapuram Road Development Company Limited (TRDCL) has been awarded with construction, operations and maintenance of 10 corridors and 3 National Highway bypass links aggregating to 42 km approximately (158 lane Km) in Thiruvananthapuram, Kerala. The project has been awarded on the basis of the lowest annuity receivable from Kerala Road Fund Board during the operations period. The Public Works Department, Government of Kerala issued bids under the Thiruvananthapuram City Roads Improvement Project ("TCRIP") and the project was awarded to a consortium of Punj Lloyd Limited and Consolidated Toll Network India Limited. A concession agreement dated March 16, 2004 was entered into among the Kerala Road Fund Board, Executive Engineer, Roads & Bridges Division (Thiruvananthapuram) and TRDCL. At present Phase I comprising of 14.3 Kms approximately (61 lane Km) is handed back to Authority, now Phase II,III and IV are in operational phase comprising of 28.117 Kms approximately (107 lane Km).

Total road network of roads is divided into four phases and as per the Concession Agreement TRDCL is entitled to receive semi –annual annuity payment as under.

- Phase-1: Rs. 5.90 Cr.
- Phase-II: Rs. 6.59 Cr.
- Phase-III. Rs. 3.33 Cr.
- Phase- IV Rs. 1.929 Cr.

Total concession period is 17.5 years including construction period of 2.5 Years. All phases of road network are under operation and maintenance now. Following are the actual COD dates for each phase.

- Phase- I: 4th July 2007
- Phase-II: 22nd February 2012
- Phase-III: 20th February 2015
- Phase-IV: 30th May 2016

Phase-I part of road network actually has been handed back by TRDCL to Kerala Road Fund Board (KRFB) and TRDCL is now maintaining balance three phases of road network.

Annuity concession agreement dated March 16, 2004 was entered into between the Kerala Road Fund Board and Thiruvananthapuram Road Development Company Limited.

The group has decided to appoint a consultant for independent assessment of operating and maintenance requirement and major maintenance requirement as per scope of work for asset of road network of Thiruvananthapuram Road Development Company Limited (TRDCL).

M/s GMD Consultants was selected for the assignment after due bidding process. GMD consultants had submitted Technical Study Report for road network of Thiruvananthapuram Road Development Company Limited (TRDCL) on 22nd May 2023.

It was desired by client to get the report updated post monsoon period. Accordingly, Consultant's Team visited all road under scope and also reviewed the maintenance requirements post monsoon. During this visit and after consulting with M/s Elsamex representatives (Maintenance Agency), it is observed that not much work has been done at site during monsoon. However, there were some additional maintenance requirements identified during visit and review. The report is hence modified and updated considering available current information during site visit and review of maintenance.

1.1 Project Asset

There are total 18 corridors of project road network. These corridors have been in divided in four phases as discussed previously. Phase- I, which has about 14.3 km of roads has been handed back to KRFB. Following figure shows location of project in regional context.

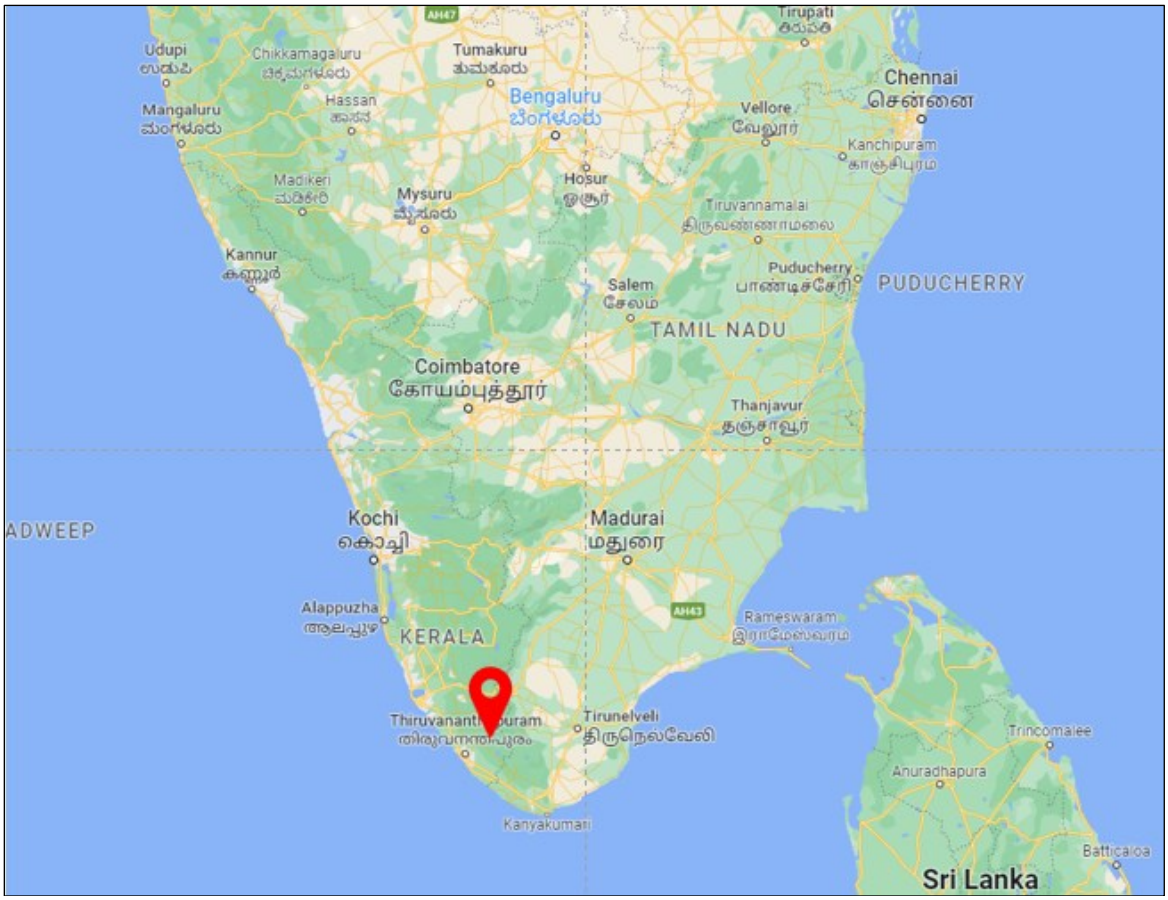

Figure 2-1 : Location Plan in Regional Context

This report fulfils part of the scope of Technical Study of Asset:

1.2 Project Stretch

Entire project road network is divided into four phases based on proximity of roads and handing over status to concessionaire. The total length of all four phases is about 42.38 km. These roads are of varying specifications. Some are four lane and some are six lanes. Few roads are even two lanes. There are some bridges, culverts and flyovers also in road network.

Following table shows summary of salient features of project stretch.

Table 2-1 : Salient Project Details

Sr. No	Item	Details	Remarks
1	Project Stretch	Road Network of Thiruvananthapuram Road Development Company Limited.	
2	Project Length	42 km (Phase-I, II, III and IV)	Phase-I roads of about 15.7 km handed back to owner

Sr. No	Item	Details	Remarks
3	Number of Corridors	18 (Phase-I, II, III and IV)	Phase-I handed back to owner
4	Pavement	Asphalt	
5	Carriageway configuration	Variable	Two Lane, Four Lane and some six lanes as well
6	Flyover	2 Flyovers	
7	Number of Minor Bridges	5 Nos.	
8	Number of underpasses	01 Nos.	Part of Phase-I Roads
9	Other Amenities	Bus Bays, Street Lighting, High mast light, footpath etc.	

1.3 Scope

The main objective of the study is to critically review the current status of project corridor including details pertaining to its construction and maintenance and to provide requisite technical information. The objective of the study can be broadly defined as follows:

I. Operations Phase:

- Undertake detailed reconnaissance to appreciate the Project corridor characteristics.
- Collection of relevant records and documents and critical review of same
- Undertake field investigations visual as well as test mentioned under asset condition assessment and to collect first-hand information on present condition of Project road and establish the requirements for rehabilitation and up-gradation
- Review of safety aspects
- Undertake preliminary designs for immediate rehabilitation requirements based on condition assessment and Concession Agreement specifications
- Review of operation and maintenance system and prepare maintenance schedule for entire duration of concession period based on a technical analysis
- Review and Preparation of O&M and major maintenance cost schedule for the concession period
- Study and highlight other relevant details like penalties, claims, petition, deviations etc which may have impact on future maintenance and cost of project

II. Asset Condition Assessment

- Assessment of road assets in conformance with specifications, standards and codes stipulated in Concession Agreement and O&M manual etc.
- A detailed inventory survey of road assets including main carriageway, structures, service roads, lightings, drains, road furniture including signage, MBCB, guard rails etc. other safety measures, toll collection infrastructure, buildings, plantation, vehicles and other objects. Comparison between requirement and actual availability at site on sampling basis based on the insurance of assets.
- Assessment of condition of the structures including but not limited to visual inspections of bearings, expansion joints, superstructure, substructures, foundations, associated components, pre-stress anchorages (if any)
- Conducting following tests
  - Trial pits for crust verification at every 15 kms
  - Falling Weight Deflectometer (FWD) test of the stretch to ascertain the existing strength of the pavement covering minimum 50% of the length.
- Assessment of condition of the road pavement including but not limited to visual inspections of the pavement, review as-built design and assess design assumptions and provide a detailed report thereon.
- Reviewing of test certificates & outcomes of past few years along with visual road condition
- Assessment of physical dimensions condition of the infrastructure to determine useful lives of the materials and equipment requiring rehabilitation and/or replacement
- Recommendations for any major repair rehabilitation and strengthening based on the condition survey and design reports
- To provide a detail photographic report of the infrastructure assets and its condition to withstand till end of concession period. Suggestion and cost evaluation for any additional repair/rectification /modification required
- Determine the appropriate level and frequency of routine and major maintenance activities required to keep the road assets in good condition and to meet the performance and O&M standards, specifications and requirements.
- Review the major maintenance work undertaken if any and prepare projections for future.

- Major maintenance expenses, so as to ensure compliance with the terms of Concession Agreement
  - Review of condition of SPV assets including ails equipment and vehicles etc.
  - Review of past accidents reports, identification of black spots, deficiency of safety requirement if any and preparation of proposal to curb accidents and safety hazard to road users.
  - Detailed major maintenance cost forecast along with estimation of costs towards handover requirements.
  - Review of existing O&M Contractor's contracts, work order and their provisions
  - Review historical O&M costs data and comment on one-off expenses, if any,
  - Review availability of labour, material and machinery at the project site and provide an assessment of operational challenges involved, if any as well as estimated costs for these

1.4 Methodology

A systematic approach and methodology have been followed for Technical Assessment of project highway. Assignment required site surveys, site data collections, document review and some preliminary designs. This requires a balanced team of experts and site engineers, design professional and senior key professionals with required skill and experience. A team consisting of judicious mix of experience and skill was deployed for the assignment.

Approach and methodology are discussed in brief as under.

A. Team

A team consisting of senior highway experts, site survey engineers, designers and document controller were put for the assignment under project In-charge having good experience in relevant highway projects. Separate teams for site survey and investigations and office design works were deployed.

B. Site Survey and Data Collection

A team of highway engineers, site supervisors and structure engineers were deployed for sufficient period at site which collected the actual field data including road/ structure inventory and supervision of field surveys. Senior expert also visited the entire stretch and interacted with project In-Charge for understanding and appreciating key aspects of project.

C. Survey and Investigations

Various surveys like FWD and trial pits were done as per standard procedures and conditions of contract. Highway and structure engineers were deployed full time for close monitoring of field investigations and surveys.

D. Designs

Designs of repair and rehabilitation for pavement was done with latest relevant tools and software as per standard guidelines like IRC-115. Software like KGP back, IITPave etc were used for analysis and design of pavement overlays.

E. Estimates & BOQs

Senior experts having good experience in road quantity estimation were deployed for estimation of various costs.

All designs and estimates were reviewed by senior highway expert.

1.5 Organization of Report

The Technical Study report covers the assessment of project road in terms of completion, quality, documentation, variations etc. The Report is organized in following 8 chapters.

1. **Introduction** - Provides outline of project asset, brief scope of assignment, methodology to execute assignment and Organization of Report
2. **Asset Appreciation** - Provides detail regarding important features/ concerns of projects including overview of physical condition of the assets.
3. **Survey and Investigations**- Includes details of various survey and investigations carried out in relation to execution of assignment.
4. **Asset Condition Analysis and Preliminary Designs** – Includes analysis of various survey and investigations, outcome of survey and investigations and preliminary designs for major repair of project elements.
5. **Road Safety Assessment and Improvement** – Review of safety compliances and accident reports
6. **Design Review** – Design Review of important elements like pavement and structures
7. **Project Document Review** - Provides analysis of review of relevant project documents like CA, Schedules, Progress Reports, Audit Reports, NCRs, Contractual Correspondence, Variations, Changes, Representations etc.

8. **Major Repair Operation & Maintenance Cost** – Cost of major repair, overlays and regular operation and maintenance
9. **Conclusion & Recommendations**

CHAPTER 2
ASSET APPRECIATION

2.1 General

Thiruvananthapuram is capital city of state of Kerala. Government of Kerala created a body in name of Kerala Road Fund Board (KRFB) which is authorised to plan, commission, operate and maintain all roads under jurisdiction of Government of Kerala.

KRFB selected certain important roads in Thiruvananthapuram city and bundled these to a package and awarded to qualified concessionaire for improvement (construction) and maintenance for certain period in lieu of Semi- Annual Annuity payments. These roads were later divided into four phases based on availability of land for construction and other factors. Start and end of concession period for these phases differ with each other.

Following table shows length of roads and corridors in four phases of project.

Table 2-1 : Project Corridor Details

SL No	Corridor	Stretch	Chainage		Length (KM)
			From	To	
1	C-01	LMS - Vellayambalam - Kowdiar	0+000	2+437	2.437
2	C-02	LMS - Attakulangara Jn.	0+000	3+373	3.373

12	AL-1	LMS- Student's Centre Road	0+000	0+244	0.244
13	AL-2	Vellayambalam-Sasthamangalam	0+060	1+326	1.264
14	AL-3	Ulloor - Kochulloor road	0+000	0+445	0.445
15	AL-4	Perookada - Vazhayila	0+000	1+433	1.433
16	BP-1	Enchackal - Sreevaraham - Attakulangara road	0+000	1+466	1.466
17	BP-2	Eanchackal - Sreekanteswaram Road	0+000	1+433	1.433
18	BP-3	NH Bypass - KIMS - Kumarapuram	0+000	3+760	3.760
		Total Length			42.385

Out of above Phase-I roads have been handed back to Authority on completion of Concession Period. Following table shows summary of road length in remaining Phase-II, III & IV

Table 2-2 : Phase wise Road Length

Project Corridor Length (KM)	Phase II	Phase III	Phase IV
	15.739	7.6	4.718

Project map in local context is shown in figure below.

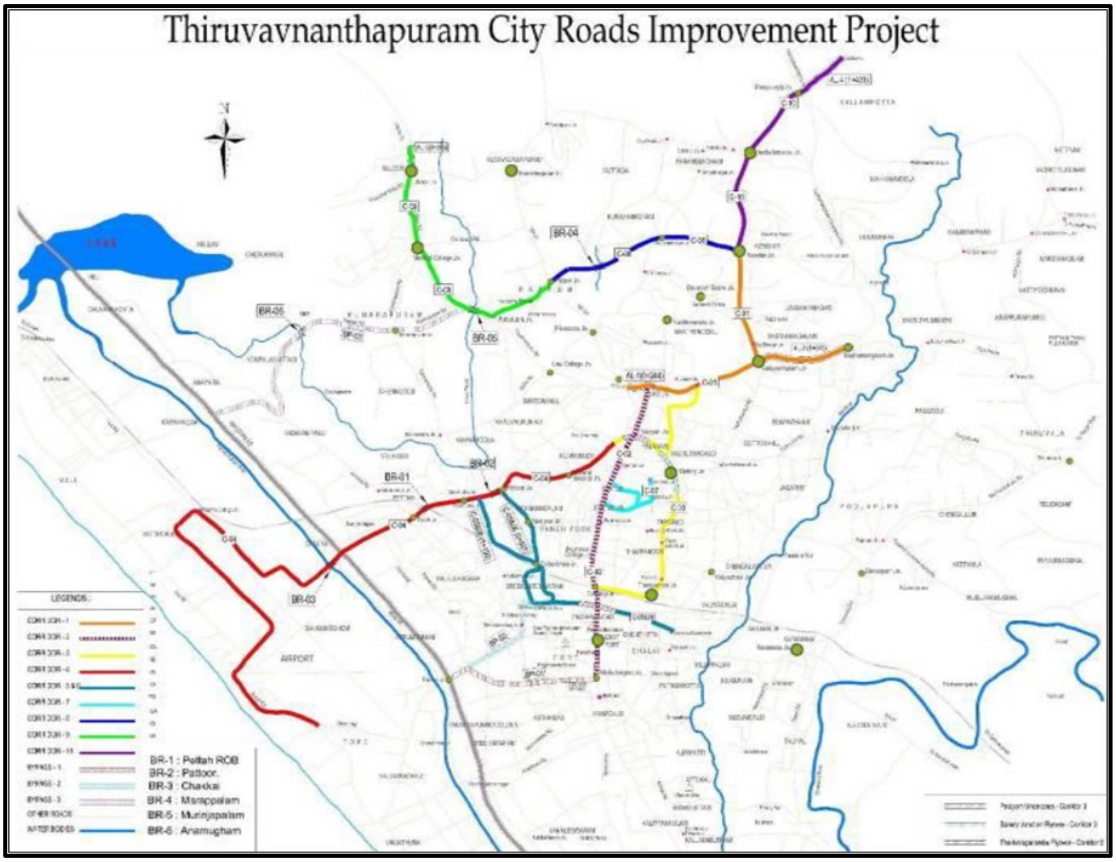

Figure 2-1: Location Plan Project Road

2.2 The Asset

Thiruvananthapuram is a mix of plain and hilly terrain. Some roads have higher longitudinal slope. Hence rainwater drains off quickly on most of the roads. All roads have mixed city traffic including NMTs. Hence most junctions have pedestrian facilities. As happens with all cities there are issues of utility trenches. At multiple location trenching of road was in progress by various authorities (Gas, Electricity, water etc). This has damaged road surface and would have to be restored.

In general condition of roads is good and major damage to road surface is not observed. Kerbs and railings are also maintained in good condition. Following table shows key features of project roads.

Table 2-3 :Key Specifications of Project

Sr. No	Item	C1	C2	C3	C-3A	C4	C5 & C6	C7	C8	C9	C-10	AL-1	AL-2	AL-3	AL-4	BP-1	BP-2	BP-3

2.3 Project Road Network Appreciation

There are total 17 corridors in entire network of project roads. Out of which 2 corridors have been handed over back to authorities by concessionaire. Hence currently 15 corridors of phases 2, 3, and 4 are being maintained by concessionaire. Approximate lengths of roads in these remaining phases is as under.

- Phase-II: 15.8 Km
- Phase-III: 7.6 Km
- Phase-IV: 4.8 Km

In general condition of road is good. Following photographs shows typical condition of airport road in project network. Condition of road assets was verified during site visit in November 2023.

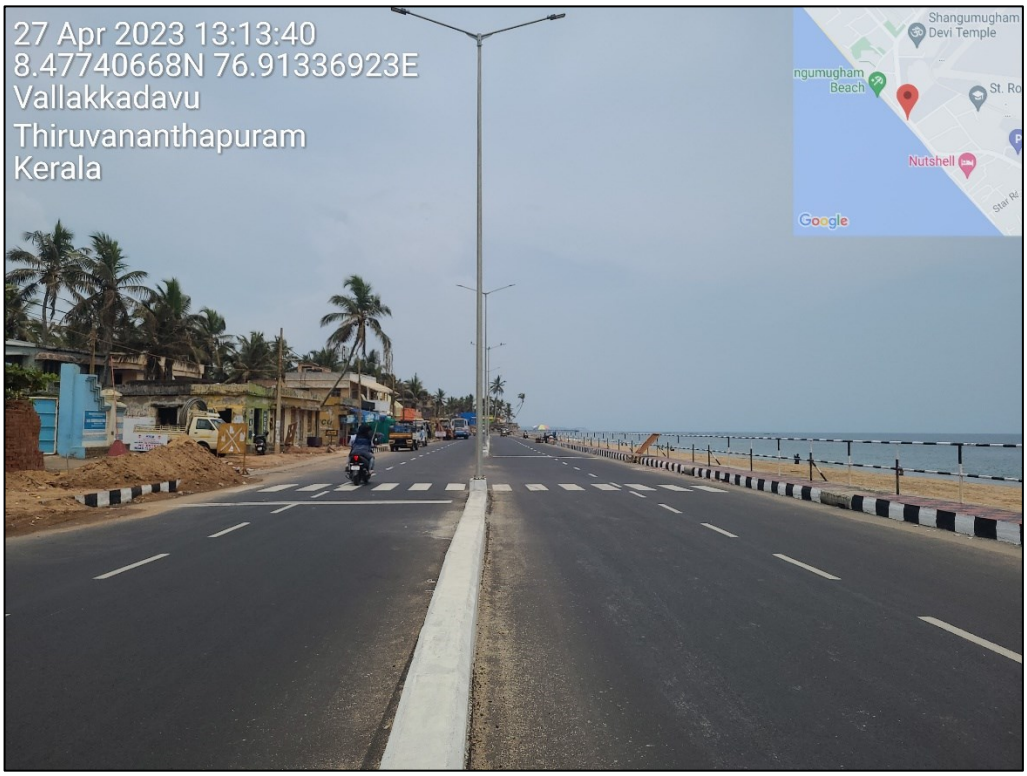

Figure 2-2: Project Roads- Airport Road (May-2023 Site visit)

Figure 2-3: Project Roads- Airport Road (Nov-2023 Site visit)

2.4 Project Road Features

As discussed previously City roads of Thiruvananthapuram under project scope have varying configuration in terms of lanes, configuration and amenities. In general, all assets are maintained in good condition. Various features of project road are illustrated as under.

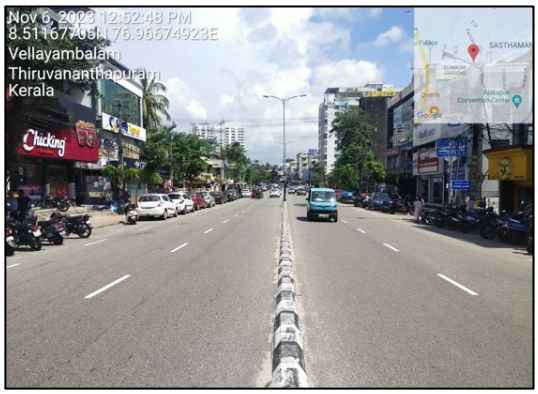
2.4.1 Road Carriageway

There are various type of road configuration in project road network. Some roads are two lane undivided carriageway with footpath on side. Some are four lane divided carriageway and some are six lane road with divided carriageway. Following photographs show typical sections of such roads.

2 Lane Configuration at BP-1 km 1+150

3 Lane Configuration at C-02 km 1+430

4 Lane Configuration at C-05 km 1+100



4 Lane Configuration at AL-02 km 0+480

6 Lane Configuration at C-02 km 1+120

6 Lane Configuration at C-03 km 3+240

Figure 2-4: Typical Road Configuration

Lengths of roads of various configurations are given in table below.

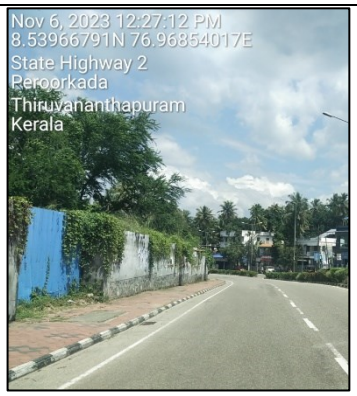
Table 2-4 :Phase wise Lane Configuration Details

Phases	2 Lane Length (m)	3 Lane Length (m)	4 Lane Length (m)	6 Lane Length (m)
Phase -02	1970	4890	4929	3979
Phase -03	2025	1407	4073	145

Phases	2 Lane Length (m)	3 Lane Length (m)	4 Lane Length (m)	6 Lane Length (m)
Phase -04	290	120	2838	147
Total	**4285**	**6417**	**11840**	**4271**

2.4.2 Footpath & Railings

Most of the project roads have footpath on side of road. Railings are also provided for pedestrian safety in some roads. Footpath is fairly maintained in most part. At few places kerb and tiles of footpath are broken.



AL-04 km 0+350

AL-01 at km 0+000

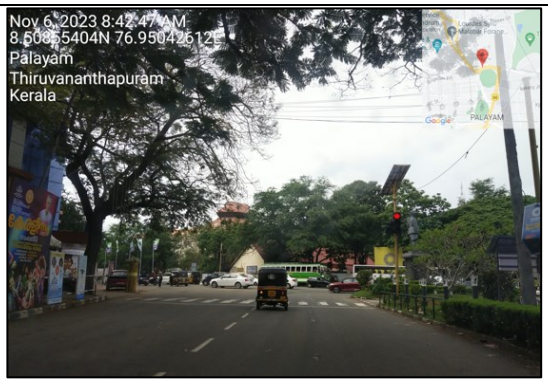
C-08 km 0+050

C-04 at km 5+700

Figure 2-5: Built Up Sections on Project Road

2.4.3 Junctions

There are large number of junctions on project roads. Junctions in general are provided with all marking and separation / channelization island. Pedestrian crossings are provided at majority of junctions.



Jn. AL-01 km 0+210

Jn. AL-04 at km 0+000

Jn. C-03 km 0+500

Jn. C-04 at C-7 km 1+480

Jn. C-07 km 0+050

Jn. C-09 at km 2+840

Figure 2-6: Junctions on Project Road

2.4.4 Bus Shelter and Bus Bays

Bus shelter and bays are provided at some locations. These are maintained by concessionaire and are in good condition.

Figure 2-7: Bus shelter and bays on Project Road

2.4.5 Street Lighting & High Mast Light

About 700 street poles with lamps and 12 high mast lights are provided by concessionaire at various locations as per scope. These are maintained by concessionaire but the bill of electricity is paid by the authority.

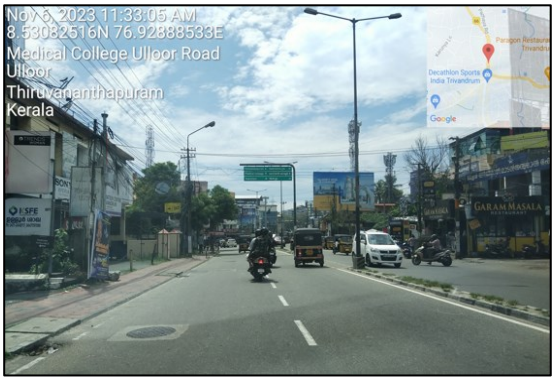


Figure 2-8: Street light and high mast light on Project Road

2.4.6 Cross Drainage Works

There are 2 flyovers, and 5 minor bridges on project road in concessionaire's scope. Condition of all structures is very good. These are recently constructed. At few places though some vegetation has grown in return walls.

MNB at BP-01 km 0+510

MJB at BP-3 km 0+860

Vegetation growth on MNB at C-4 km 5+670

Culvert structure at C-4 km 5+750

MNB Substructure at C-4 km 5+700

Culvert Structure at C-6 km 2+530

Canal structure at C-8 km 0+470

Figure 2-9: Bridges on Project Road

There are some cleaning issues though at some locations. Overall condition of project assets is good.

CHAPTER 3

SURVEYS AND INVESTIGATIONS

3.1 Scope

Consultants have conducted various site investigations and surveys on project road to collect important details for Independent Assessment of Operation and Maintenance of project road and major maintenance if any.

Following survey and investigations have been done on project stretch to capture condition of project assets and for the purpose of preliminary designs to assess maintenance and major maintenance requirements as per scope of work.

- Structural soundness of pavement – FWD (Falling Weight Deflectometer)
- Trial Pits
- Pavement Condition Assessment – Road Inventory
- Structural Condition – Visual Inventory

3.2 Schedule of Survey & Investigation

All survey and investigations were done as per standard guidelines and scope of assignment. Following table provides schedule of survey and investigations.

Table 3-1 : Schedule of Investigations

Sr. No	Type of Survey	Specification	Period
1	Falling Weight Deflectometer (FWD) Test	Entire Length	24-04-2023 to 25-04-2023
2	Trial Pit	At 4 locations	27-04-2023 to 30-04-2023
3	Road Inventory-01	Entire Length	24-04-2023 to 30-04-2023
4	Structure Inventory	Entire Length	24-04-2023 to 30-04-2023
5	Road Inventory-02	Entire Length	06-11-2023

FWD and trial pit testing was done in May 2023 which still holds good as there is practically no change in road and structure condition.

3.3 Falling Weight Deflectometer (FWD)

Structural Condition of pavement is normally evaluated using deflection measurement of pavement with passing load. Benkelman Beam Deflection (BBD) and Falling Weight Deflectometer (FWD) are two popular methods for the purpose. FWD being more accurate among the above methods was used for pavement strength evaluation.

FWD survey and subsequent analysis is carried out to ascertain the relative performance of the pavement for all Project Stretches, in the context of evaluating residual life, overlay and other maintenance requirements.

Methodology of Falling Weight Deflectometer

Falling Weight Deflectometer is a non-destructive pavement testing device which provides relatively accurate data on the response of the pavement (specifically the surface deflection bowl) to dynamic loads by simulating actual wheel loads in both response and duration. This allows more accurate and rapid measurement of pavement deflection under load than traditional methods like BBD.

Figure 3-1 : FWD Survey in progress on project roads in Thiruvananthapuram

A dynamic load is generated by the dropping of a mass from a pre-set height onto a 300 mm diameter plate. The magnitude of the load and the pavement response are measured by a load cell and nine geophones. One geophone is located immediately under the load, whilst the others are located at variable offsets from the centre of the load. The test load is varied between 7 and 150 KN to meet the requirements of the particular task and the pavement response for up to four different magnitudes of load are measured during any test sequence. The offsets of the geophones can be set to any distance up to 1800 mm from the centre of the load and a typical sequence is completed in approximately one minute. Highly accurate deflection bowl measurements are therefore obtained; therefore, it is very useful for carrying out large-scale pavement surveys.

The FWD is integrally mounted in a dedicated vehicle. All testing is controlled by a personal computer which is located in the vehicle. As a result, only one operator is required to conduct a survey on most occasions making it less labour/ equipment intensive than traditional methods. Following is the typical process of FWD survey and investigation.

3.3.1 Working Principle

- A set of weights is dropped onto a platform with springs (rubber buffers) and the impact load is transferred to the pavement through a loading plate.
- The load simulates the dynamic load from a truck.
- Normally, the load applied on road pavements is 40 kn.
- When subjected to a load, the pavement will bend, and a deflection bowl is created. The deflections at various distances from the loading centre are recorded by the sensors (geophones) and stored in a data file.

3.3.2 Survey &Data Collection

Survey and data collection using FWD includes typically the following.

- Preparing the FWD unit for deflection testing
- Bringing the FWD to a stopped position at the beginning of the test section, centred on the outside wheel path (or specific position), and take a measurement by applying load using following sequence:
- One settling drop to ensure proper contact.
- Three drops with an applied load of 40 KN ± 10% (or Specified Load).
- Deflections are recorded from the sensors located at the centre of the loading plate for each drop except the settling drop.
- Along with these deflection data, the parameter like Chainage, Temperature, Date and Time and position of Sensors will also be recorded.
- After each measurement, drive the FWD forward to next measurement point.

Analysis Stages:

Analysis including back calculation of layer moduli and remaining life analysis is done on the basis of standard procedure and guidelines as give in IRC - 115 and KGPBACK, presented in the Chapter 5.

Back calculated FWD field data is placed at Annexure-2

3.4 Trail Pit

Visual inspection of the existing pavement condition has been carried out prior to commencement of pavement investigation work to finalize the test pit locations.

In order to verify the configuration of pavement layers trial pits have been done on edge of pavement. Following Pictures shows trial pit survey in progress at project site. Trial Pits are carried out to assess the adequacy of the pavement layers and effectiveness of the existing pavement layers.

Figure 3-2 : Trail Pit Survey arrangement

Condition and thickness of existing sub-grade, Granular layer Bituminous Layer by taking sample test pits at 4 locations was noted. Trial pit was done at the interface of paved shoulder and earthen shoulder in the size of 1m x 1m. Pavement composition details (pavement course, material type, and thickness) are recorded at every test pit. Trial pits were closed and filled back after testing from road safety point of view.

3.5 Road Inventory

Existing inventory of features of Project Stretch is captured through physical inventory. Features like built-up settlements, carriageway dimensions, service roads, junctions, road furniture etc. are recorded for entire Project Stretch. Chainage of project roads are not clearly marked on city roads. Reference of chainages have been taken from prominent features on project road like junction, bus bay, major showroom etc.

Detailed photos of road inventory are presented in Appendix-1.

A detailed road-wise visual inspection of pavement was done. Most part of pavement in project road is complete and is in good condition. Traffic is plying on road and there are high rains in in this part of country which has resulted damages and stresses at certain location on project roads.

Following some representative photographs depict typical condition of road in this stretch.

Table 3-3 : Summary of Pavement Condition

Stress / Damage Type	Length (m)
Fair	6190
Potholes	825
Patch Work	395
Distressed	245
Rutting	200
Gas pipeline Work in progress	870
KSEB Work in progress	2550

Potholes, patchwork, distressed or rutting as shown in above are isolated small locations. There is no continuous stretch which is damaged and can be taken up to major repair. Hence only few locations which required urgent repair are taken in immediate repair cost. Rest can be covered in regular yearly maintenance works.

Detailed condition inventory of road is attached at Annexure-1

3.6 Structure Inventory

Detailed site inventory of structures was done during field site surveys. Main features recorded as part of structure inventory survey are as listed below:

- Bridge number/ Name
- Location (Chainage)
- Type of structure (Major bridge, minor bridge, pipe culverts, box culverts, slab culverts, underpasses, flyovers etc.) and year of construction if available from records.
- Span Arrangement details like numbers of spans, span length, vent height from deepest stream bed level.
- Details and type of vehicle restraint systems such as safety barriers or R.C.C railing or parapet wall.
- Clear width and overall width of structure.
- Main features recorded as part of detailed condition survey are listed below.
- Condition of wearing coat such as potholes, cracks, and patches.
- Condition of expansion joints such as bump in riding, leakage in expansion joint, damaged sealing compound, silt and debris filled in expansion joint gap.
- Damaged and missing details of RCC railing/ safety barrier/ parapet wall.
- Damaged and missing details of drainage spouts and down take pipes extended below the soffit of deck slab, status of drainage spout chambers filled with debris and silt and missing or damaged gratings, covered on rainwater collection chambers.
- Spalling of concrete from super structure and sub structure elements.
- Delamination in girders, soffit of deck slab and substructure.
- Corroded reinforcement exposed anywhere in deck slab and substructure.
- Mapping of cracks in girders, deck slabs, sub structure.
- Visible voids and honey combing in concrete surfaces.

All the structures in project roads are completed recently say at the most 15 years back approximately. Hence all elements of structures like slabs, girders, bearings, expansion joints abutments etc are in good condition. There is no repair required other than cleaning.

Following figures show condition and status of few structures.

Flyover at C-03 km 0+990

Vehicular Underpass at C-3A km 0+390

ROB at C-06 km1+250

Flyover at C-06 km 2+040

Figure 3-4 : Typical Structure Condition on project road.

3.7 Safety Items

Concessionaire has provided safety items like crash barriers, railings, etc as per schedule. Solar Blinker, Signages, metal beam crash barrier and Lighting is provided in stretch. Generally, all items are in good shape except that a few locations metal beam crash barrier and Pedestrian guard rail at built-up locations is damaged.

CHAPTER 4
ASSET CONDITION ANALYSIS AND PRELIMINARY DESIGNS

4.1 Road Pavement Condition

Road pavements are layered structures comprising of combination of materials to carry traffic load in given climate for a specified time interval. The pavement structure is designed in such a way that the transmitted stresses due to wheel load are sufficiently reduced, so that they will not exceed bearing capacity of the sub-grade. It should also be able to provide a surface of acceptable riding quality under all weather conditions with the highest possible degree of safety.

The performance of any road pavement is measured by two indicators, namely Functional Performance and Structural Performance. The functional performance includes aspects such as riding quality, surface distress and skid resistance. Whilst recognising these functional requirements, the pavement should also have adequate strength so as to carry the traffic load under the prevailing environmental conditions (structural performance).

Table 4-1 : Typical Distress Types Associated with Performance

Performance Type	Performance Indicator
Functional	Riding Quality (Roughness and Rutting)
Surface	Distress (Cracking, Potholes, Ravelling etc.) Skid Resistance Structural Deflection, Elastic Modulus of Pavement layers and Remaining Life

Information about pavement condition and performance is critical to the decision-making process for successful management of road pavements. The objective of condition assessment of the pavement is to collect accurate and timely data, analyse the level of deterioration, identify maintenance and reconstruction needs, and determine maintenance costs both routine as well as periodic (major maintenance).

In this context, series of investigations and assessments were undertaken using a combination of state of the art, technology driven fully automated and semi-automated processes with high speed of data collection in field.

After collecting the pavement condition data from tests, the data is analysed to evaluate the pavement performance or condition. Following are the key aspects in this regard.

- Test Pit for evaluation of pavement material properties
- Structural Condition Assessment of the pavement and remaining life.

The remaining life of the pavement {in terms of the residual fatigue causing traffic load in MSA (Million Standard Axles) that the pavement can sustain} is evaluated using the data obtained from Falling Weight Deflectometer (FWD) survey and Test-pit survey results. The design traffic in terms of MSA for each year ahead is calculated based on the VDF obtained from axle load data and traffic projections.

The key steps involved in strength evaluation of pavement are as follows

1. Data collected from surveys is analysed for estimating different parameters like Remaining life of Pavement, design traffic projections in MSA.
2. The Remaining Life of the pavement is evaluated using the FWD and Test-pit survey results as per **IRC: 115-2014.**
3. The traffic projections (MSA) are obtained from the combined results of axle load and historical traffic data.
4. Each stretch is divided into homogeneous sections and all the above parameters are listed for each section.
5. The sections with lesser remaining life are proposed for structural overlay.
6. The sections which have remaining life more than the design life but are poor in riding quality or are damaged at surface, are also considered for the functional overlay.
7. Sections which satisfy both the functional parameters as well have a life more than design life are considered for routine maintenance only.

4.1.1 Estimation of Axle load and Vehicle Damage Factor

Concessionaire has provide the design reports of various corridors. It was confirmed that roads have been constructed with the same design. Traffic volume and traffic loading (MSA)for various roads in horizon years is taken from these design reports. Following table shows summary of design and traffic loading of various corridors of project road network.

4.1.2 Estimated Design Traffic

The design traffic is considered in terms of the cumulative number of standard axles in both directions of the carriageway during the design life of the road. This can be computed using the following equation:

$$N = \frac{365 \times [(1+r)^n - 1]}{r} \times A \times D \times F$$

Pavement design of roads has been provided by concessionaire and traffic loading of various road considered in design has been taken for analysis of remaining life of pavement. The estimated yearly design traffic considering the traffic (as per design report) is worked out for each road. One sample traffic loading on road C-08 is given in table below:

Table 4-2 : Traffic Loading at Project road C-08

Year	Lane Factor	VDF	MSA		Remarks
			HS-1	HS-2	
2003	0.75	2	0.28	0.12	Year of Survey
2004			0.3	0.12	Completion of construction
2009			1.56	0.66	
2014			3.36	1.42	First 10 Years
2019			5.45	2.31	
2024			7.88	3.33	Final design period (20 years)

4.1.3 Roughness

Roughness is one of the important parameters for determining the functional characteristics of pavements. According to American Society for Testing and Materials (ASTM), roughness is defined as “the deviations of a pavement surface from a true planar surface with characteristic dimensions that affect vehicle dynamics, ride quality, dynamic loads, and drainage, for example, longitudinal profile, transverse profile and cross slope”.

Bump Integrator Roughness (BI) is used to define the characteristics of a longitudinal road profile and constitutes a standardized roughness measurement. BI is measured in

metre per kilometre (m/km). Concessionaire has done testing of roughness as per contract. As per the reports values of roughness index are with in acceptable limits except at those places where some excavation or trenching work is done by utility authorities.

The roughness of road surfaces is measured using different equipment/techniques such as rod and level survey, dip stick profiler, profile graphs, response type road roughness meters and profiling devices. Roughness investigation was done using fifth wheel bump integrator (developed by CRRI) and is reported as Unevenness Index (UI) in mm/km. Following table gives details of surface riding quality evaluation criteria.

Table 4-3 : Roughness Index Criteria

Condition	Roughness Range BI (in mm/km) for Bituminous Concrete Surface
Excellent	Less than 2000
Good	2000-2500
Average	2500-3000
Poor	More than 3000

**Source: IRC: SP:16-2004

Concessionaire has got roughness test done recently in November 2022. Following graphs show the representation of test results. As per the test report roughness in all the corridor is within acceptable limit of 3000 except on one location.

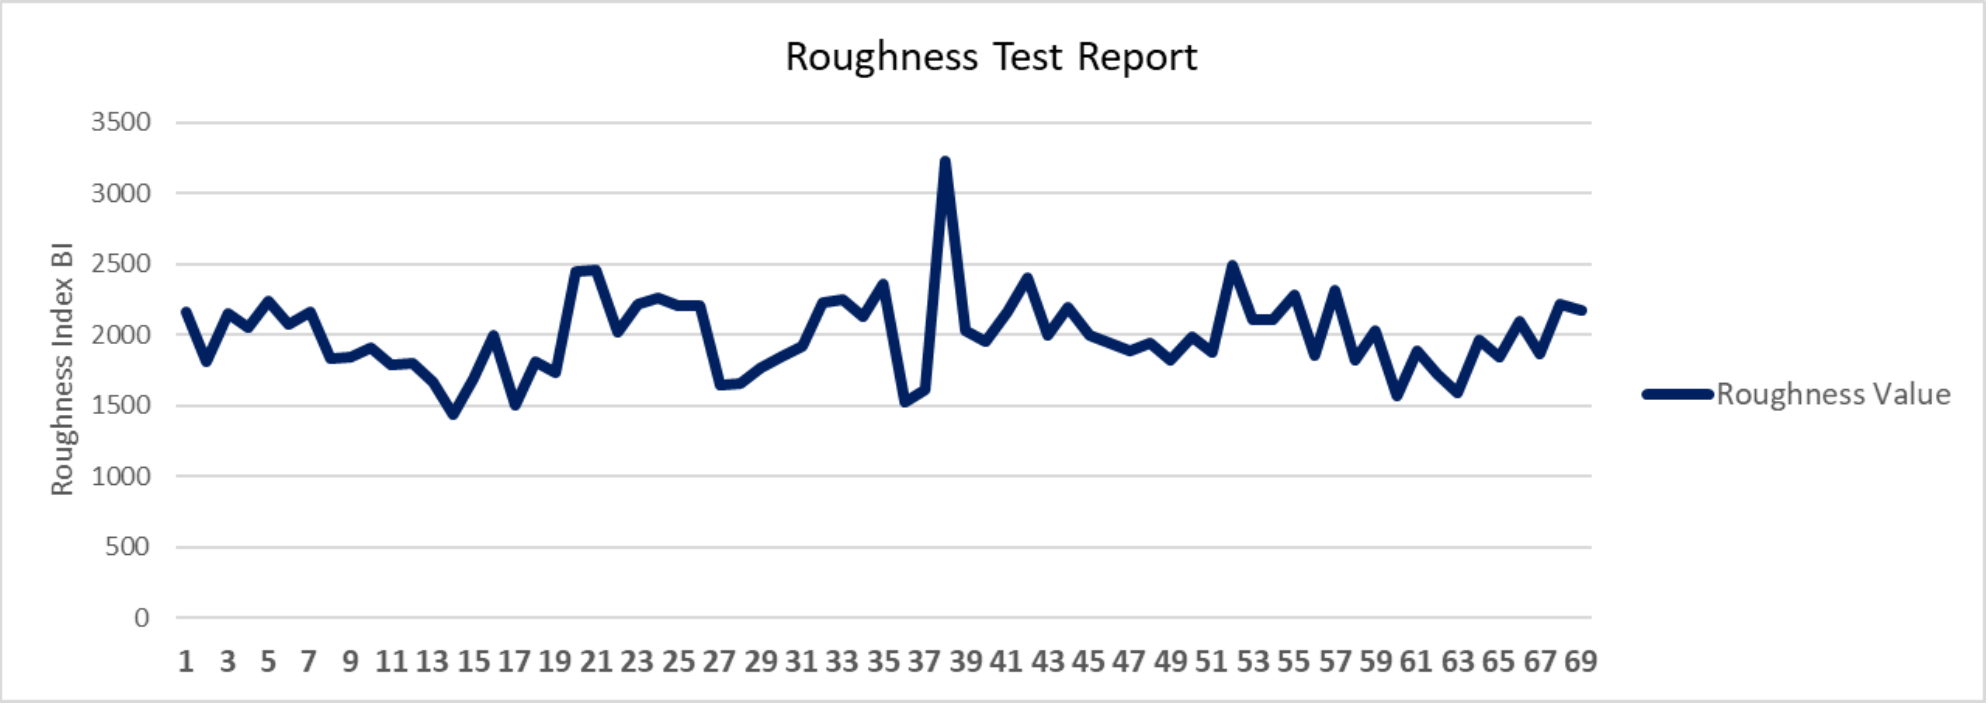

Figure 4-1 : Roughness Index for Project Road Network

4.1.4 Existing Pavement Composition and Analysis

Existing pavement composition (pavement course, material type, and thickness) was recorded at every trial test pit dug at 4 locations along the Project Stretch. The pavement composition was checked at defined interval to understand the construction layers laid on the project road and its correlation and analysis of residual life and strengthening requirement. Pavement of balance stretches is taken from design report

BP-03

C-04

C-07

C-09

Figure 4-2 : Trail Pit Survey

The summary of existing pavement crust thickness as obtained from trial pit testing and is presented in following table.

Table 4-4 : Existing Crust Thickness

Sr.No.	Date	Trial Pit No.	Location / Chainage (Km)	SIDE (LHS/RHS)	BITUMINOUS THICKNESS (mm)	GRANULAR THICKNESS (mm)	TOTAL (mm)
1	29.04.2023	1	C-04	LHS	90	450	540
2	30.04.2023	2	C-07	LHS	90	460	550
3	30.04.2023	3	C -09	LHS	120	510	630
4	30.04.2023	4	BP-03	LHS	90	450	540

The Average granular layer thickness varies from 450 mm to 510 and bituminous layer thickness varies from 90 mm to 120 mm. Pavement thickness of other roads have been taken from design and drawings of pavement.

Detailed photos of Trial pit testing are presented in Appendix-3.

4.1.5 Determination of Structural Strength of Pavement using FWD and Remaining Life Analysis

Pavement structure is typically composed of several layers of different material, each of which receives the loads from the above layer, spreads the load, and then passes the load to the layer below. Material layers are usually arranged with in a pavement structure in order of descending load bearing capacity with the highest load bearing capacity material on the top and the lowest load bearing capacity material on the bottom. In general pavements should be designed to perform satisfactorily without developing unacceptable levels of distresses during the design life period. The structural adequacy of the existing pavement is demonstrated based on the study of structural performance of the pavement. If a pavement shows load associated distress like fracture, permanent deformation etc., then it is considered to have failed structurally. To ensure that unacceptable levels of distresses do not occur during design period, the critical strains developed under the load should be less than the limiting strain values corresponding to the design traffic selected. Structural evaluation of pavements involves application of a standard load to the pavement and measuring its response in terms of stress, strain or deflection. Among the equipment available for structural evaluation of pavements, the Falling Weight Deflectometer (FWD) is extensively used world-wide because it stimulates, to a large extent, the actual loading conditions of the pavement. The resulting load-deflection data can be interpreted through appropriate analytical techniques, such as

back calculation technique, to estimate the elastic module of the pavement layers. The computed module is, in turn, used for

i. The strength evaluation of different layers of in-service pavements
ii. the estimation of the remaining life of in-service pavement
iii. determination of strengthening requirement, if any and
iv. Evaluation of different rehabilitation alternatives (overlay, recycling, partial reconstruction, etc.).

The guidelines for the test and evaluation of structural condition of in-service pavements are detailed in IRC- 115:2014. The test was carried out using 300mm diameter plate and standard load of 40KN (+/-4KN). The deflections were measured at 7 points, each at a radial distance of 0, 200, 300, 450, 600, 900, and 1500 (all mm). The pavement layer thicknesses of Bituminous and Granular layers were obtained from the test pits as given above.

4.1.6 Analysis Methodology

provides detailed procedure for the evaluation of structural condition of in-service pavements using deflection data from Falling Weight Deflectometer as well as other pavement data as inputs to a back-calculation model for determining the elastic module of pavement layers, and, thereafter, using these modules as inputs to a pavement design model for estimating the overlay requirement.

Accordingly, the sequence of analysis steps as per the IRC: 115-2014 is as follows.

1.The recorded data will be normalized to a standard load of 40 KN.

2.The normalized deflections will be then processed and back calculated using KGPBACK to obtain Elastic Modulus values of Bituminous, Granular layer and Sub-grade.

3.The corrections factors for temperature correction sand seasonal variations will be applied to all layers as suggested in IRC: 115-2014.

4.Preparation of Homogenous sections and selecting 15th percentile Module values for the purpose of design.

5.Checking the in-service ability of the Pavement layers through Performance criteria-analysing the Remaining life. Sequence of FWD data analysis and snapshot of applications used for analysis are presented in figures below.

Sequence of FWD data analysis and snapshot of applications used for analysis are presented in figures below.

4.1.7 Procedure

The FWD measurements have been carried out at spacing of 250 and 500 m per lane at slow lane and fast lane respectively in the provided stretches.

Figure 4-4 : FWD Survey in Progress

deflections measured by the FWD equipment are influenced by pavement temperature. Measurements made when the pavement temperature is different than standard temperature has be corrected. The deflection measurements, pavement temperature, subgrade soil & deflection, and other information collected during the deflection study have been recorded.

Following procedure has been followed for measurement of FWD:

- The test location is marked on the field.
- The loading plate along with the deflection sensors have been lowered at the test location.
- The target load has been applied and the deflections have been measured for 3 times.
- The first load is considered as a seating load and the values are not considered for analysis.

Detailed photos of FWD test are presented in Appendix-2.

Temperature Measurement & Correction

The standard temperature for doing the experiment is 35^0C. Since it is always not possible to conduct the test at the standard temperature, a correction factor has to be

applied for the deflection. The correction factor is determined by knowing the temperature at the time of the survey. The pavement temperature during the survey has been measured at every one-hour interval by drilling a hole of 40mm in the pavement and filling it with glycerol and measuring the temperature using digital thermometer. The temperature correction factor applied on bituminous back calculated moduli is calculated as

$$ET1 = \prod ET2$$

Where,

$\prod$, temperature correction factor, is given as

$$\prod = 1\text{-}0.238 \ln T1 / 1\text{-}0.238 \ln T2$$

Where,

ET1 = back calculated modulus (MPa) at temperature T1 (°C)

ET2 = back calculated modulus (MPa) at temperature T2 (°C)

Correction for Seasonal Variation

Moisture content affects the strength of subgrade and granular subbase/base layers. The extent to which the strength is affected will depend on the nature of subgrade soil, gradation and nature of fines in the granular layers, etc. For the purpose of applying these guidelines, it is intended that the pavement layer moduli values should pertain to the period when the subgrade is at its weakest condition. In India, this period occurs during the recession of monsoon. It is, therefore, desirable to conduct deflection measurements during this period. Where the same is not feasible, a correction procedure should be adopted. The correction factor for subgrade and base is as

- **Correction factor for subgrade**

E sub_mon = 3.351* (E sub_win) ^ (0-7688)-28.9

E sub_mon = 0.8554*(E sub_sum) - 8.461

where,

E sub_mon = subgrade modulus in monsoon (MPa)

E sub_win = subgrade modulus in winter (MPa)

E sub_sum = subgrade modulus in summer (MPa)

- **Correction factor for granular layers**

E gran_mon = - 0.0003 *(E gran_sum) ^ 2 + 0.9584* (E gran_sum) - 32.989

E gran_mon = 10.5523 *(E gran_win) ^ 0.624 – 113.857

where, E gran_mon = granular layer modulus in monsoon (MPa)

E gran_win = granular layer modulus in winter (MPa)

E gran_sum = granular layer modulus in summer (MPa)

4.1.8 Back Calculation to Obtain Resilient Modulus of Existing Layers

Software used:

KGPBACK – Genetic Algorithm based software for back calculating the layer moduli. Works on three-layer system (Bituminous, Granular & Subgrade).

Data required:

- Deflections at various radial distances.
- Existing layer thickness – the existing layer thicknesses of various stretches have been obtained from the test pit.
- Layer moduli range – the layer moduli adopted for the analysis is shown in next section.
- Poisson's ratio: BT-0.5, Granular-0.4, Subgrade-0.4 (For Back calculation).

Table 4-5 : Range of module (MPa)

Type of Layer	Lower and Upper Limit (MPa)	
	Good to Fair	Fair to Poor
Subgrade	50 to 100	50 to 100
Granular	100 to 500	100 to 500
Bituminous	750 to 3000	400 to 1500

4.1.9 Data Analysis

Resilient Moduli of each layer are calculated using KGPBACK for each test point. Details of input parameters are given in Annexure-2. The summary of back calculated and corrected module of the all the three layers are presented in the following table.

Table 4-6 : Corrected Back Calculated Module (MPa)

4.1.10 Remaining Life and Overlay Estimation

The in-service three-layer pavement system has been analysed with the 15th percentile back-calculated corrected layer moduli and layer thicknesses. The critical strains have been calculated by IITPAVE program. From the performance criteria equations, the residual/remaining rutting and fatigue life has been estimated.

4.1.11 Performance Criteria

The layer moduli of in-service pavement back calculated from FWD deflection data are used to analyse the pavement for critical strains which are indicators of pavement performance in terms of rutting and fatigue cracking. The remaining life of pavement can be obtained using the Fatigue and Rutting criteria mentioned in IRC – 115:2014 and in IRC-37:2018, the same approach can be used for design of bituminous overlays for existing flexible pavements. The performance models are as follows.

Fatigue in Bituminous layer:

As specified in IRC-37:2018, the fatigue model for 90 percent reliability (4.0 % air voids and 11.5% bitumen) was used as below;

$N_f = 0.9206 * 10^{-04} \times [1/\varepsilon_t] 3.89 * [1/MR] 0.854$

Where, N_f = fatigue life in number of standard axles,

ε_t = Maximum Tensile strain at the bottom of the bituminous layer

MR= resilient modulus of the bituminous layer.

Rutting in Subgrade:

Rutting model for 90 percent reliability level as specified in IRC: 115-2014 was used as below.

$N = 1.41 \times 10^{-08} [1/\varepsilon_v] 4.5337$

Where, N= Number of cumulative standard axles,

ε_v= Vertical strain in the subgrade.

The initial requirement of the overlay for strengthening of the existing pavement was done increase the residual life of the pavement. The basic principle considered in calculating the initial overlay requirement is as under

- Calculation of overlay thickness on the basis of calculated design traffic in MSA to be on the project road by period.
- The rutting life which is the life of granular layer should be more than the 25yrs design traffic in MSA.
- The remaining fatigue life before every periodic maintenance should be minimum of 30% such that it may have sufficient structural strength and be suitable for

maintenance measures like crack sealing, micro-surfacing and patching (IRC:37-2018).

- There is conventional provision of BC overlay at the end of concession period at the time of handover. Taking this into account stretches having remaining life less than concession period have been taken up for overlay.
- Future strengthening of pavement has been integrated with periodic maintenance to optimize overlay on pavement.

Following table provides summary of overlay requirement on various road sections and enhanced balance life after overlay.

Table 4-8 : Overlay Requirement on Project Roads

The overlay thickness recommended for the project road is based on the remaining fatigue life, existing pavement condition, riding quality and maintaining profile of the project road which is presented in table below.

Details calculation of overlay is placed at Annexure -3

Recommended overlay thicknesses per FWD analysis is given as under in various years. The overlay is designed on the assumption that after overlay remaining life of pavement would increase up to end of concession period or beyond that.

Additionally, an overlay of 30 mm SDBC overlay is considered just before handover of respective stretches of various phases. Following table shows handover overlay in various years (end of concession period).

Table 4-9 : Hand back Overlay Schedule

Corridor Name	Chainage From	Chainage To	Length m	Phase	2023-2024 (For 6 Months)	2024-2025	2025-2026	2026-2027	2027-2028	2028-2029	2029-2030	2030-2031

4.2 Structure Condition

Condition of structures is good in project. All structures of project have been recently constructed. All elements of structures including abutments, slabs, girders, bearings, parapet expansion joint etc are in good condition and do not require any repair immediately. There are issues of cleaning and vegetation growth at joints of structure which should be taken care of.

Following table provides visual assessment of condition of structure.

Table 4-10 : Structure details of Project Road

Sr. No	Corridor	Chainage	Type of Structure	Condition of Structure	Proposed construction/repair works
1	BP-3	0+888	MNB	Abutments, Slabs, Parapet, deck are in good condition	Regular cleaning of bed near abutments
2	C-03	1+050	Flyover	Abutments, Piers, girders, deck slab etc are in good condition	Regular maintenance & Cleaning
3	C-04	5+670	MNB	Abutments, Slabs, Parapet, deck are in good condition	Regular cleaning of bed near abutments
4	C-06	1+200	ROB	Abutments, Piers, girders, deck slab etc are in good condition	Regular maintenance & Cleaning
5	C-06	2+100	Flyover	Abutments, Piers, girders, deck slab etc are in good condition	Regular maintenance & Cleaning
6	C-06	2+530	MNB	Abutments, Slabs, Parapet, deck are in good condition	Regular cleaning of bed near abutments
7	C-08	0+470	MNB	Abutments, Slabs, Parapet, deck are in good condition	Regular cleaning of bed near abutments

4.3 Miscellaneous Items

Repair requirement of miscellaneous items like crash barriers, drains, pedestrian guard rails, marking, kerbs etc is derived from road inventory.

CHAPTER 5

ROAD SAFETY ASSESSMENT & IMPROVEMENT

5.1 ROAD SAFETY AUDIT

Road Safety is one of the most important aspect of any highway project which has been assigned high priority in all modern contracts. There has been no formal road safety audit on project.

5.2 Road Safety Audit Observations

Concessionaire has provided various road safety items like railings, pedestrian markings, crash barriers, footpaths, islands, signage, markings etc. Still during inspection of site, it was observed that at number of places marking of hazards and delineation of kerbs and islands is missing which could be important for safety of traffic. Such locations have been identified during inventory of road and required item has been taken as part of improvement.

CHAPTER 6

DESIGN REVIEW

6.1 General

Design is one of the important aspects of highway project. Project roads are city roads where most the traffic in passenger traffic. Hence in general traffic loading on project road is less. Pavement & Structure design of project are discussed here as under.

6.2 Pavement Design

Pavement design is basically interplay between ground strata strength and traffic loading on pavement. Pavement design of TRDCL roads has been reviewed in light of above.

A. Soil Strata

Thiruvananthapuram is partly a hilly city and it is expected that it would have a good sub soil strata. In design of new pavement is done on CBR of 6%. If CBR of existing soil is less than this then it shall be removed and replaced with soil having CBR 6% or more.

B. Traffic Loading & Thickness Design

Design of pavement has been done on the basis of IRC:37-2001. Total design period has been taken as 20 years. Composition of traffic in Thiruvananthapuram is predominantly buses and few LCVs. There are only few trucks. Keeping that in view a VDF of 2 is taken which appears to be appropriate. Traffic growth is taken a 3%. Lane distribution factor is taken as per road configuration. For two lane undivided carriageway lane distribution factor is taken as 0.75.

Granular layer has been designed for entire design period or minimum 20 years. Stage construction for first 10 years of pavement life is considered. Asphalt layers has been designed for minimum design period of 10 years as per new code.

Asphalt layers have been designed for 10 years traffic which shall be strengthened as required. Design Pavement composition for project roads is given as under.

Table 6-1 : Proposed Pavement Crust Thickness for Roads Widening / New

Corridor Name	Pavement Composition widening portion	Pavement Composition Existing Carriage Way	
C1	SDBC -25MM BM - 80MM WMM - 250MM GSB - 260MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN BM
C2	BC - 40 MM DBM - 90 MM WMM - 250 MM GSB - 260MM	BC - 40 MM DBM - 50 MM	PROFILE CORRECTION COURSE IN DBM
C3	BC - 40 MM DBM - 90 MM WMM - 250 MM GSB - 260MM	BC - 40 MM DBM - 50 MM	PROFILE CORRECTION COURSE IN DBM
C-3A	BC - 40 MM DBM - 90 MM WMM - 250 MM GSB - 260MM	BC - 40 MM DBM - 50 MM	PROFILE CORRECTION COURSE IN DBM
C4	SDBC -25 MM BM - 65 MM WMM - 250 MM GSB - 200 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN BM
C5 & C6	SDBC -25 MM BM - 65 MM WMM - 250 MM GSB - 260 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN BM
C7	SDBC -25 MM BM - 65 MM WMM - 250 MM GSB - 210 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN BM
C8	SDBC -25 MM BM - 65 MM WMM - 250 MM GSB - 200 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN DBM
C9	SDBC -40 MM BM - 80 MM WMM - 250 MM GSB - 260 MM	SDBC -40 MM BM - 50 MM	PROFILE CORRECTION COURSE IN DBM
C-10	SDBC -25 MM BM - 65 MM WMM - 250 MM GSB - 260 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN DBM

Corridor Name	Pavement Composition widening portion	Pavement Composition Existing Carriage Way	
AL-1	SDBC -25 MM BM - 80 MM WMM - 250 MM GSB - 260 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN BM
AL-2	SDBC -25 MM BM - 80 MM WMM - 250 MM GSB - 260 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN BM
AL - 3	SDBC -40 MM BM - 80 MM WMM - 250 MM GSB - 260 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN BM
AL - 4	SDBC -25 MM BM - 65 MM WMM - 250 MM GSB - 260 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN DBM
BP - 1	SDBC -25 MM BM - 65 MM WMM - 250 MM GSB - 200 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN DBM
BP - 2	SDBC -25 MM BM - 65 MM WMM - 250 MM GSB - 200 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN DBM
BP - 3	SDBC -25 MM BM - 65 MM WMM - 250 MM GSB - 200 MM	SDBC -25 MM BM - 50 MM	PROFILE CORRECTION COURSE IN BM

Strengthening of road has been designed on the basis of BBD analysis and overlay requirement is worked as per IRC-81:1997

Pavement design for project roads is as per IRC provisions and since city roads handle only light traffic, thickness of various layers of pavement appears to be adequate.

6.3 Structure Design

Design drawing of structures were studied at site. All designs of structures are approved by IE.

CHAPTER 7

DOCUMENT REVIEW

7.1 General

Construction of Project roads of TRDCL in Thiruvananthapuram is complete. Various phases of project roads have been completed as under.

- November 16, 2006 (Phase I)
- February 22, 2012 (Phase II)
- February 20, 2015 (Phase III)
- May 31, 2016 (Phase IV)

Roads of phase-I have been handed over to KRFB by concessionaire. Balance roads are under operation and maintenance phase. Documents and correspondence form important part of due diligence and help is getting insight into important aspects of project. Documents of project were studied in concessionaire office in Thiruvananthapuram. Observations of document review are summarised in this chapter.

7.2 Design Documents

Sample of design documents which were made available during site visits were examined. Following is the summary of major design aspects of project.

Pavement Design

Flexible pavement is adopted in entire stretch of road except locations where existing pavement was concrete pavement. Pavement design of project is done in accordance with provision of IRC-37 (Flexible Pavement). Details of pavement design are discussed in separate chapter dedicated to subject.

Structure Design –

There are few structures in project. There are two flyovers and 5 minor bridges. Design of all structure is approved by IE before awarding COD.

7.3 Progress Reports

Progress Report of IE have been studied for insight into project regarding quality, scope, variations, conflicts type concerns. As discussed, construction of all the roads is complete, and project is in operation phase hence no critical balance items is pending. IE reports do not mention and major concern. Most of the issues mentioned

in MPRs are of typical O&M operation pertaining to cleaning, minor damages, debris etc. Concessionaire O&M team attends to such complains and observations. Hence there no critical concern mentioned in progress reports.

7.4 Safety Audits

Formal safety audit of project roads is not done as it is not part of scope of Concessionaire. However, consultant team has identifies some missing safety items on road and same have been incorporated in cost.

7.5 Contract Correspondence

Contract correspondence between IE and Concessionaire and Concessionaire and Authority (KRFB in this case) provides insight into progress of project and various issues / concerns appeared during course of implementation and operation of project. Following table provides summary of major concerns emerged out of Contract Correspondence. The project is already completed hence most of the correspondence is about change of scope and regular maintenance. However, there are two pending issues which are reflected multiple documents and correspondence. These are discussed as under.

1. Handing Over and Taking over of Phase-I roads.

Concessionaire has submitted letters to KRFB regarding handover of all roads of phase-I for which concession period is over. (Ref TRDCL dated 7th November 2022)/ Concession period of phase-I road ended on 7th July 2022 as per COD of phase-I. As per the document overlay of only one road in Phase-I, i.e., BP-03 is balance. There is utility trenching working going on in the stretch. Overlay in this 780 m road will be done only when utility work is completed. Concessionaire has stated that they will not be doing and operation maintenance of Phase-I road now. And in fact concessionaire is not doing any O&M work in phase-I road. Authority (KRFB) is asking for some additional documents which concessionaire has submitted. During discussion with concessionaire on this it was revealed that KRFB intends to float tender for maintenance of Phase-I road and even asked concessionaire to submit their quote for O&M of phase-I roads. Hence it appears that there is no major issue regarding handing over of Phase-I road and it will happen eventually in near future.

2. Holding of Annuity Payment.

As regular requirement of project scope Concessionaire does roughness and BBD test on project roads. In September 2017 KRFB got independent test of roughness done by NATPAC in which some 22540 m of road was found to exceed BI threshold value and was declared non-available. Accordingly, Authority KRFB withheld some part of annuity against non-availability of stretches.

Concessionaire contested the same and got a fresh roughness test done in October 2021 and in which all tests were observed to be within acceptable limits. Later Concessionaire agreed to do overlay on such roads and completed the overlay in all roads except two roads, BP-03 – 780 m and C-03 - 590 m. The work of overlay in these two roads is not done as some utility work is going on in these roads. Now authorities are NOT withholding the annuity payment for such roads but the previous withheld annuity payment is still not released.

Following table shows summary of withheld amount by authority.

Table 7-1 : Statement of Annuity Withheld

TCRIP Annuity Summary (PH-1, PH-2, PH-3 & PH-4) as on 31-03-2023										
SL No	**Deatils of Phase**	**Semi Annuity Amount in Cr.**	**Period**	**Total Due Annuities Amount in Cr.**	**Annuity Received Amount in Cr.**	**Regular Annuity in Process Cr.**	**Annuity Retained (as per CA) Amount in Cr.**	**GST Recovery (Pending) Amount in Cr.**	**Annuity Withheld (Contested by TRDCL) Amount in Cr.**	**Remarks**
1	**Phase - I**	5.90	Up to 30th Annuity	177.00	168.04		6.02		2.94	
2	**Phase - II**	6.59	Up to 22nd Annuity	144.98	122.74			1.1862000	22.24	Phase -II 22nd Annuity payment received on 29-03-2023
3	**Phase - III**	3.33	Up to 16th Annuity	53.28	36.72			0.599400	16.56	Phase -III 16th Annuity payment received on 29-03-2023
4	**Phase - IV**	1.93	Up to 13th Annuity	25.08	19.068				6.009	
	TOTAL	**17.75**		**400.34**	**346.56**	**0.00**	**6.02**	**1.7856**	**47.75**	
Total Amount									**55.56**	

Concessionaire has contested above withheld amount and has submitted a claim of Rs. 358.67 Cr. against additional work beyond scope, idling of resources, interest, escalation of price etc. Matter has gone to arbitration now and is currently under hearing.

7.6 Non- Conformance

The project is complete, and COD is achieved. Hence there is no pending NCR of construction period. There are pending issue of non-available stretches and withheld annuity which has been discussed as above.

CHAPTER 8

MAJOR REPAIR & OPERATION & MAINTENANCE COST

8.1 General

All the road of project are complete and under operation and maintenance now. Projects roads have been constructed to the design and specification regular maintenance of project roads is done by concessionaire. During inspection of project roads, it was observed that there are certain items on project roads which need immediate repair to bring the project road to specification. Such items and works can be taken as immediate repair works. Thus, total cost of Repair, Operation and Maintenance of project road during entire life of project can be classified into following category.

A. **Immediate Repair**

B. Regular Operation and Maintenance

C. Periodic Operation and Maintenance (Major Maintenance)

Details of above operations and cost are discussed in subsequent sections of this chapter.

8.2 Immediate Repair

Items like broken footpaths, railings, crash barriers, faded markings, missing signages etc come under immediate repair and its cost is worked out. Since project roads are actively maintained by Concessionaire, the damaged locations are scattered and are small in lengths, such cost of immediate repair is very less. Table given below shows quantities of various items taken under repair and locations.

Additionally, TRDCL had taken up some major maintenance work which was awarded to contractors. Some part of it is still balance. This cost shall also be part of immediate cost. Same is given in second table below.

Table 8-1 : Immediate Repair Quantity Details(For balanced 6 Months)

From Inventory (Immediate Repair)																	
Item Description	**Unit**	**C-02**	**C-03**	**C-04**	**C-05**	**C-06**	**C-07**	**C-08**	**C-09**	**C-10**	**AL-01**	**AL-02**	**AL-03**	**AL-04**	**BP-01**	**BP-03**	**Total**

Table 8-2 : Balance Cost of MMR work for FY 2023-2024 (For 6 Months)

SL No	Agency Name	Description	Total (in Rs Cr)	Completed (in Rs Cr)	Billed (in Rs Cr)	Un Billed (in Rs Cr)	Balance	Total to be considered post 1st April 2023
1	M/s Thoppil	BM/SDBC	12.39	12.39	11.01	1.38	-	1.38
2	M/s Project IQS	BM/SDBC	2.7	0.87	0.87		1.83	1.83
Total Amount Excluding GST								**3.21**

Cost of above items under immediate repair is given in table below.

Table 8-3 : Immediate Repair Cost Excluding GST (For balanced 6 Months)

Items	Amount (Rs.)
Broken PGR	266000
Median Marker	2942420
Hazard Marker	600000
Road Marking	5132336
BC Overlay	171188
Tack Coat	8855
Road Studs at Median	86250
Total Amount (in Rs.)	9207048
Total Amount (in Cr.)	**0.92**

Table 8-4 : Total Immediate Repair Cost Excluding GST (For 6 Months)

Items	Amounts
Balance cost of MMR work for FY 2023-2024	3.21
Immediate Repair Cost	0.92
Total Amount (in Cr.)	**4.13**

Rates of various items in all costs are taken from current contracts running on project which are relevant.

8.3 Regular Operation and Maintenance

Regular Operation and Maintenance consists of mainly following items.

- Routine Road Repairs
- Routine Structure cleaning
- Route Maintenance
- Drain Cleaning
- Landscape maintenance
- Street Light Maintenance
- Tree Pruning
- Patrolling

- Crane Operation and Maintenance

A dedicated manpower is required for effective maintenance of any asset. Current manpower structure of Concessionaire is effective and sufficient for maintenance of project asset. Following table provides details of manpower taken for cost projection. Current organization of concessionaire is mapped into this manpower.

Table 8-5 : Concessioner Staff Details

Concessionaire Staff	Unit	Base Rate (Rs)	Quantity	Amount (Rs.)
Project Manager	Salary/Month	200000	1	2400000
Asst.Manager	Salary/Month	100000	1	1200000
Site engineer	Salary/Month	75000	2	1800000
Admin Officer/ Account Officer	Salary/Month	40000	1	480000
Office Support staff	Salary/Month	15000	1	180000
Driver	Salary/Month	22000	4	1056000
Miscellaneous	Peon/ Office Boy/ Security etc	20000	3	720000
Total Sub Head				**7836000**

Concessionaire has developed an inspection / maintenance plan as per contract. Various regular damages / repair requirements are generated on the basis of this inspection plan. Inspection / Maintenance plan is attached at Annexure-4.

As discussed previously projects roads are actively maintained and are in good condition. It is proven fact that good maintenance results in less maintenance cost as well due to timely intervention and repair of damaged road. Following assumptions are made for working the regular maintenance cost against pothole, cracks, paint fading, kerbs breaking etc.

Table 8-6 : Assumed Routine Maintenance %

Defect	% Qty per year
Pot Hole	0.10%
Rutting	0.05%
Minor Cracks	0.10%
Major Crack	0.05%
Thermo Paint	50.00%
Kerb Paint	50.00%
Handrail Maintenance & Painting	50.00%

Defect	% Qty per year
Road Studs	30.00%
Signages	2.00%

Annual Cost of above items including miscellaneous costs also like office rents, staff cost, testing cost etc is given in table below. The cost is taken as per existing running contracts.

Table 8-7 : Routine Operation and Maintenance Cost for FY 2023-2024

(For 6 Months)

Items	Amount (Rs.)
A. Routine Civil Repair Work	
Pothole Patch Repairs	3,76,602
Other Repairs	8,28,525
Landscape Watering	1650000
Landscaping	1452000
Tree Pruning	462000
Road Studs	24750
Thermoplastic paint	697125
Kerb painting	583838
Handrail maintenance	350000
Handrail painting	90625
Overhead Sign Painting	13500
Street Light Painting	173950
Replace damaged Sign boards	25000
Signal Maintenance	330000
Removal of weeds on footpath	294840
Catchpit cleaning	300522.6
Bus Shelter cleaning	2310
Signal Aspect cleaning	18585
Construction of street light/signal foundation	33027.75

Items	Amount (Rs.)
Replacement of damaged kerb at edge	118004.25
Replacement of damaged kerb at Median	63525
Cleaning of sign boards	37396.8
Restoration of footpath settlements	458640
Replacement of damaged drain cover	83969.55
Carriageway cleaning 2 lane	264600
Carriageway cleaning 4 lane	148837.5
Covered drain cleaning	1296233.4
Vehicle rent for removal of waste from footpath including	462000
Vehicle rent for removal of waste from Yard	480000
Street light maintenance	1155000
B. Routine Operation Maintenance	
Patrolling Vehicle (CF Test)	192500
Patrolling Vehicle (250km / day)	800250
Crane	55,000
BBD and Roughness Test	392929
Concessioner Man Power	3918000
Office Rent	165000
Yard Rent	178200
Total Amount (in Rs.)	17977285
Total Amount(A+B) (in Cr.)	**1.80**

This regular maintenance cost would vary in subsequent years due to handing over of some roads as their concession period of respective phase gets over. Following table shows cost of routine operation and maintenance in concession period at current price.

Table 8-8 : Cost of Routine Maintenance at current rates over concession period

Year	Routine Maintenance Cost (Cr)
2023-2024 (For 6 Months)	1.80
2024-2025	3.47
2025-2026	3.47
2026-2027	3.42
2027-2028	2.19
2028-2029	2.19

8.4 Periodic Operation and Maintenance

Periodic operation and maintenance cost mainly consist of structural overlays on pavements, major repairs and replacements of expansion joints and bearing of structures.

While assessing the major repair cost of pavement with the help of FWD data analysis repair intervention was designed on the basis of remaining life of pavement.

Future periodic intervention is planned on the basis of projected MSA and remaining life of pavement taking original crust design and major repair into consideration. Following table summarises periodic interventions during concession period of project. Overlay is in Bituminous concrete and figure in respective year against a road is overlay of BC in mm.

Table 8-9 : Periodic Maintenance Interventions

S.No.	Chainage		Length	Side	Hand over Year	Balance life of pavement in years Before Overlay	2023-2024	2024-2025	2025-2026	2026-2027	2027-2028	2028-2029	2029-2030	2030-2031	2031-2032	2032-2033	2033-2034	2034-2035	2035-2036	2036-2037	2037-2038	2038-2039

Total Length (m)							**2138**	**5528**	**0**	**4648**	**4476**											

Cost of overlay as designed above is shown in table below. Cost of handover overlay on roads also has been added in periodic maintenance cost in respective years. The rates for various items are taken from current awarded work. There is a provision of price escalation in awarded contract for variation in rate of bitumen. Rate of asphalt items for current year is escalated as per this clause of escalation. An escalation of 3% is taken in bituminous items while as 5% escalation per year is taken in other ancillary works for future years.

Current rates of major items are given in table below.

Table 8-10 : Base Rates of Periodic Maintenance Items excluding GST

Items	Unit	Rates
SDBC Overlay	Cum	13474
BC Overlay	Cum	14821.4
Milling	Cum	72.15
Tack Coat	Sqm	23
Thermoplastic Road Marking	Sqm	507
Kerb	Rmt	429
Kerb Painting	Sqm	150

Cost of Periodic Maintenance on current rate in current year (2023-24) is given as below.

Table 8-11 : Periodic Maintenance Cost for FY 2023-2024 (For balanced 6 Months)

Items	Amount (Rs.)
BC Overlay	8952745
Tack Coat	347323
Thermoplastic Road Marking	721921
Kerb	3096694
Kerb Painting	384840
Total (in Rs.)	13503523
Total (in Cr.)	**1.35**

Cost of overlay in respective year at current price is given in table below. Concessionaire plans to do a SDBC overlay on all stretches at the time of handover to authority. Same has also been considered in future cost. The costs are exclusive of GST in these tables.

Table 8-12 : Cost of Periodic Maintenance at Current Rates Excluding GST

Year	Periodic Maintenance Cost (Cr)
2023-2024 (For 6 Months)	1.35
2024-2025	1.90
2025-2026	0.00
2026-2027	13.06
2027-2028	1.56
2028-2029	0.00
2029-2030	4.60
2030-2031	4.00
2031-2032	0.00

Above cost are exclusive of GST

8.5 Total Cost of Operation and Maintenance

Total cost of operation and maintenance consist of both regular and periodic maintenance. As discussed previously standard cost of routine maintenance of road is moderated in lieu of major repairs in horizon years.

Combined Operation and Maintenance Expense (OMEX) is given in following table both at current rates and with escalation as discussed previously.

Table 8-13 : Total OMEX (Periodic & Routine) at current rates Excluding GST

Year	Routine Maintenance Cost (Cr)	Immediate Major Repair	Periodic Maintenance Cost (Cr)	Insurance Premium	Total Cost
2023-2024 (For 6 Months)	1.80	4.13	1.35		7.28
2024-2025	3.47		1.90		5.38
2025-2026	3.47		0.00		3.47
2026-2027	3.34		13.06		16.39
2027-2028	2.13		1.56		3.69
2028-2029	2.13		0.00		2.13
2029-2030	2.06		4.60		6.66

Year	Routine Maintenance Cost (Cr)	Immediate Major Repair	Periodic Maintenance Cost (Cr)	Insurance Premium	Total Cost
2030-2031	1.49		4.00		5.49
2031-2032	0.30		0.00		0.30
Total Cost					**50.80**

Cost of Total OMEX after application of escalation and GST is shown in table below.

Table 8-14 : Total OMEX (Periodic & Routine) Including GST & Escalation

Year	Routine Maintenance Cost (Cr)	Immediate Major Repair	Periodic Maintenance Cost (Cr)	Insurance Premium	Total Cost
2023-2024 (For 6 Months)	2.12	4.87	1.59	0.14	8.72
2024-2025	4.31		2.32	0.28	6.91
2025-2026	4.52		0.00	0.30	4.82
2026-2027	4.56		17.03	0.31	21.90
2027-2028	3.06		2.10	0.14	5.30
2028-2029	3.21		0.00	0.15	3.37
2029-2030	3.26		6.63	0.16	10.05
2030-2031	2.48		5.96	0.06	8.50
2031-2032	0.52		0.00	0.07	0.59
Total Cost					**70.16**

For better representation and appreciation above cost of project repair, operation and maintenance is illustrated in following figure.

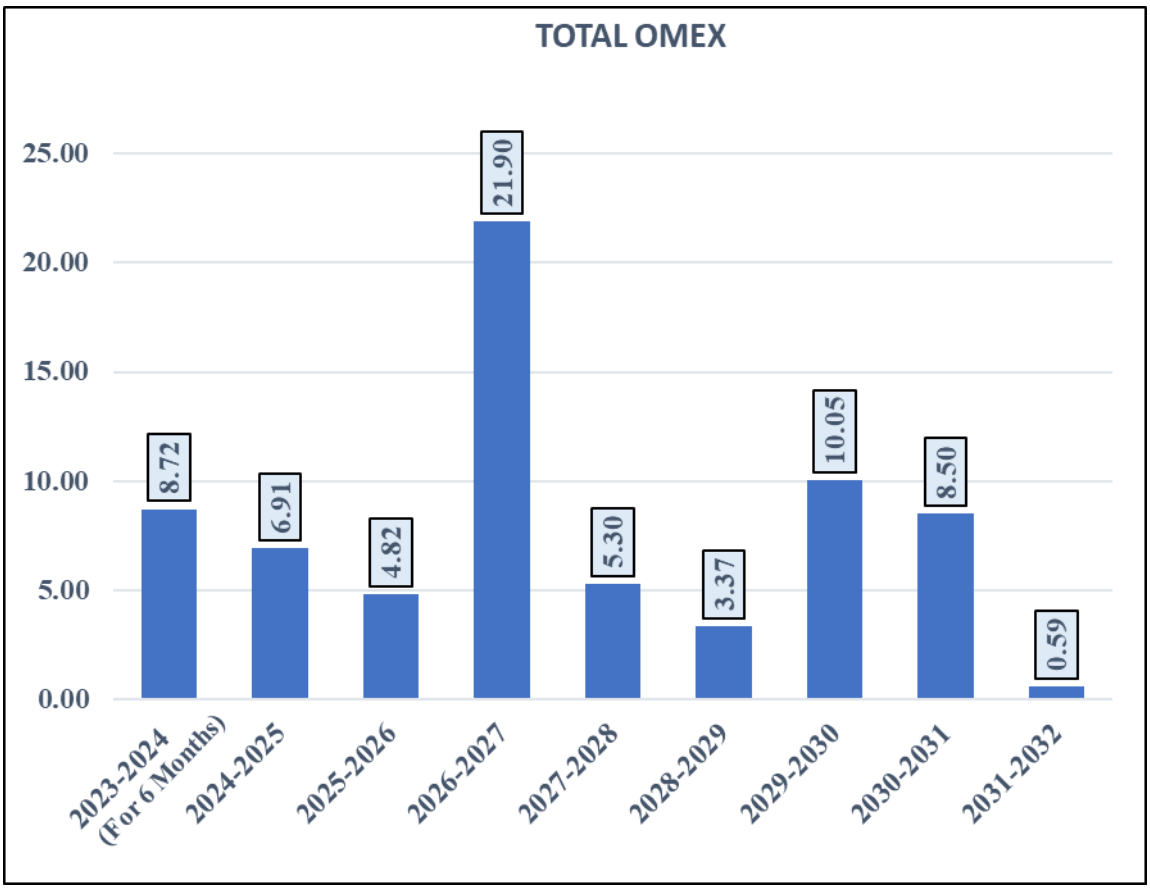

Figure 8-1 : Total OMEX Cost including Escalation and GST

Details of operation and maintenance are given in Annexure-5 (Excel Soft Copy).

CHAPTER 9

CONCLUSION & RECOMMENDATION

9.1 Conclusion & Recommendations

TRDCL was awarded construction and operation maintenance of about 42 km of city roads of Thiruvananthapuram by Kerala Road Fund Bord. TRDCL has completed construction of all roads and all roads are under operation and maintenance. Condition of all the roads is good and Concessionaire has good setup for Operation & maintenance. Assessment of requirement of major repairs and periodic overlays has been worked out and has been presented in report. It is not expected that any additional major repair on project roads would be required under normal circumstances. Concessionaire attends to damages done in road pavement due to works done by Utility departments or others at KRFB Cost which issues work order to Concessionaire for such repairs. Hence such costs are not liability of Concessionaire.

Concessionaire is getting regular payment of Annuity now but previously annuity payment was withheld by authority for non- availability of road stretches. Total of such annuity withheld payment is Rs. 47.75 Cr. TRDCL has requested release of same as all repairs are done now and also has submitted a claim of Rs. 358.67 Cr.

Process of handing over phase-I road is in progress.

Assignment and Scope of Work (1)

Moradabad Bareilly Expressway Limited (the "Client") is the first asset of the road portfolio of Roadstar Infra Investment Trust which is Infrastructure Investment Trust (InvIT) established by the Infrastructure Leasing & Financial Services Limited (IL&FS). The Client has commissioned Translink Infrastructure Consultants Private Limited (the "Consultant" or "TICPL") to carry out independent assessment of operating and maintenance requirements and major maintenance requirements.

The Client owns Design, Build, Finance, Operate and Transfer (DBFOT) Toll road asset of 121.8 km covering Moradabad - Bareilly section of NH24 in Uttar Pradesh (the "Asset"). Total project cost was INR 1,267 crore as per RFP.

The Consultant has submitted final report in May 2023. The client decided to get incremental due diligence in November 2023.

This document is revised final report incorporating effect on O&M and major maintenance requirements and its cost projections for balance concession period due to O&M work executed during June - September 2023 and reconnaissance survey exercised in November 2023..

Objective of the assignment

Reference discussion with the Client at proposal stage and during kick-off meeting, objective of the study is to evaluate O&M and major maintenance requirements and its cost projections for balance concession period for the Asset. Deliverables of this study is for internal consumption of the Client and no sharing of the deliverables with any third party for any other purpose is envisaged.

Scope of Work

The broad scope of the work of this assignment is as follows:

- **Operations phase:**
  - Detailed reconnaissance survey, field investigations and collection of first-hand information on present condition of the Asset to establish the requirements for rehabilitation and up-gradation;
  - Review of relevant records and documents;
  - Review of safety aspects;
  - Prepare maintenance schedule (routine and periodic) for balance concession period based on a technical analysis;
  - Study and highlight other relevant details like penalties, claims, petition, deviations etc. which may have impact on future maintenance.
- **Asset condition assessment:**
  - Assessment of highway components and structures, detailed inventory survey of asset and comparison between requirement and actual availability at site on sampling basis based on the insurance of asset;
  - Reviewing of test certificates and outcomes of past few years along with visual road condition;

Assignment and Scope of Work (2)

- Critical review of pavement condition survey and preparation of pavement inspection report to suggest probable rehabilitation treatment and rectification strategies;
- Existing pavement need to be categorized as Good, Average and Poor based on their estimated life span;
- Recommendations for any major repair, rehabilitation and strengthening based on the condition survey and design reports; Photographic report of the infrastructure assets and its condition to withstand till end of concession period;
- Suggestion and cost evaluation for any additional repair/rectification /modification required;
- Determine the appropriate level and frequency of routine and major maintenance activities required to keep the road assets in good condition and to meet the performance and O&M standards, specifications and requirements;
- Review of past accidents reports, identification of black spots, deficiency of safety and requirement if any and preparation of proposal to curb accidents and safety hazard to road users;
- Detailed routine and major maintenance cost forecast along with estimation of costs towards handover requirements.

Approach and Methodology (1)

TRANSLINK® Infrastructure Consultants Pvt Ltd *Smart Consulting*

Approach

During the kick-off meeting, the Client preferred to have independent assessment by the Consultant before sharing their O&M strategy and O&M contracts in practice. Hence, the Consultant followed consultative and iterative approach from inception to address the need of the assignment.

Methodology

The Consultant reviewed documentation made available by the Client in piecemeal basis across the duration of the assignment, conducted reconnaissance survey of the Asset and undertaken field investigations to identify key aspects impacting asset quality, compliance to obligations of the Concession Agreement and adherence to safety standards.

To deliver the agreed scope of work and to meet the objective of the assignment, the study was divided into following four stages:

- **Stage 1: Review of documentation**
  - First tranche (pre-site visit) documentation i.e. Concession Agreement (CA) including schedules which define the requirements and obligations of Operation & Maintenance and limited monthly compliance reports of Independent Engineer, were studied to identify focus areas requiring site validation and detailed investigations in line with assignment objective.
  - Additionally, design and as-built drawings, COS and PCOD documentation from reports prepared by Lender's Independent Engineer / Authority's Independent Engineer, limited field investigations reports of recent past (BI Test, NSV Report, Structure Condition Report) made available by the client were analysed for comparison with field surveys.
- **Stage 2: Site visit, asset inventory and visual condition assessment**
  - As-built drawings, requirements of facilities and furniture as per CA Schedule B were studied and list of items required to be verified during inventory surveys were identified.

  Outputs of these activities mainly includes:
  - Gaps in as-built asset and design drawings
  - Present condition of the Asset as per progress/compliance reports of Lender's Independent Engineer / Authority's Independent Engineer
  - List of pending works in case of pending items, ongoing maintenance work in FY24
  - Defect Liability Period along with start-end point of Four laning of Rampur Bypass on EPC mode
  - Pending approvals and/or compliance comments from authority etc.

  Correlation of these two stages were considered to bring out critical areas for the subsequent stages of the review.

Approach and Methodology (2)

- **Stage 3: Field investigations**
  - Surveys and investigations were carried out to collect all the field data during April 2023.

List of field investigations conducted

Activity	Purpose	Output
Reconnaissance survey	Site appreciation	Asset characteristics
Inventory of roads, bridges and CD structures	Gap assessment against As Built	Inventory of the Asset
Visual inspection of Bridges without Mobile Bridge Inspection Unit (MBIU) and Visual Pavement Condition Survey (PCS)	Functional condition assessment	Probable rehabilitation measures and supporting role to conclusions derived from NDT, if any
Trial pits (every 15 km)	Identification of Crust thickness	Validation of Pavement Crust
Falling Weight Deflectometer (FWD) Test	Structural Condition of Pavement	Residual life of pavement

- **Stage4: Estimation of O&M, major maintenance requirement and OPEX projections**
  - Based on inputs from condition assessment and analysis of field investigation results, the Consultant arrived at one-time repair/rectification/modification requirement and associated cost as per obligations of CA in base year (FY24).
  - O&M / MM Requirement and OPEX estimate were based on the Consultant's independent analysis of pavement condition, structure condition and requirement for up-keep of road furniture, safety standards and requirement for hand-over stage (first-cut).
  - OPEX projections were determined during balance concession period based on rate analysis and in-house database of the Consultant.
  - First cut projections were optimized in line with the Client's O&M Strategy and cost optimization.

Input

- Identified gaps in context of Schedule B, C & D
- Defect liability period of ongoing work under EPC Contract if any
- Inferences from field investigation results
- Balance concession period as per CA
- Traffic projections provided by the Client
- Toll operations cost
- Rate analysis / Schedule of Rates
- Benchmarking exercise

Output

- **Major Maintenance Cycles for balance concession period**
- **Routine maintenance** (edge repair, crack sealing. patching, drainage)
- **Periodic and major maintenance** (preventive treatments, rehabilitation, pavement reconstruction)
- **Cost of operations** (toll, utility, manpower, incident management)

Data shared by the Client (1)

Particulars	Status
Signed concession Agreement – all volumes	Received
Monthly O&M Reports including compliance notes and observations of consultants (IE and LIE) from PCOD/COD	5 IE Reports received – Nov'22 to March'23 3 LIE Reports received – Dec'22 to Feb'23
Latest reports for roughness / NSV results / FWD (or BBD) / Pavement Condition Survey **Concession Agreement - Article 17.3: "Maintenance Manual" approved by authority/IE** **O&M Manual - Reference Clause 3.1.4: Inspection Report (Visual, Close and Thorough) as per prescribed frequency from PCOD/COD** **O&M Manual - Reference Clause 1.3.3: Roughness Test bi-annually (pre and post monsoon) from PCOD/COD** **In accordance with the above, details of maintenance (structural / functional) activities executed every year from PCOD/COD**	NSV Report (Feb'22) Received Structure Condition Report (March'23) BI Test Reports (April'22 and Oct'22) Contractor-wise Daily Progress Report for ongoing Major Maintenance & Repair Works as on 4th May 2023 (Rajinder Infrastructure Private Limited, Atcon India Limited, Jalakash)
As built and Design Drawings for project components	Received
Strip chart of LHS and RHS	Received
Road asset inventory reports	Spread-sheet of asset inventory received (Period of details compiled is not mentioned)
Copies of O&M Contracts / Agreements for routine and major maintenance for minimum last 5 years	Operations and Maintenance Agreement executed on 24th December 2021 among the Client, Elsamex Maintenance Services Limited and Roadstar Investment Managers Limited valid till end of Concession Period Annexure I – Payments & Reimbursables is missing in the document.
Year-wise historical expenditure and present year budget for routine and major maintenance	Month-wise Annual Maintenance Plan for 2023-24
Audited Financial Statements along with detailed notes (P&L, Cash flow and Balance Sheet) since PCOD/COD to understand historical Routine, Preventive and Major Maintenance	Single item received - Independent Audited Report for year ended 31st March 2022 O&M item-wise expense details not available
Audited Financial Statements along with detailed notes (Profit & Loss, Cash Flow and Balance Sheet) since PCOD/COD to understand historical Routine, Preventive and Major Maintenance	Single item received - Independent Audited Report for year ended 31st March 2022 O&M item-wise expense details not available

Data shared by the Client (2)

Particulars	Status
Details and Correspondence for Change of Scope (Construction and O&M Stage)	Received
EPC Agreement for 2 lane existing bypass of Rampur to be developed to 4 lane	Received
Future Traffic Projections / Traffic Due Diligence Report	FY 2023 AADT, VDF data, growth rates received
Client in-house rates for major maintenance activities	Received
Insurance Policy details	Received
Past Technical Due Diligence Reports	Technical Due Diligence Report (Revised Final Report October 2020) by Feedback Infra Private Limited
Manpower renumeration details	Received
Yearly accident reports along with data for minimum last 5 years	Accident data at Black Spots 2016, 2017 & 2018 Accident data in IE Reports - Nov'22 to March'23

Chapter 2: Asset Profile

- Location and network
- Key details of the asset
- Concession timeline and key stakeholders
- Quantitative summary of physical features
- Present modality of O&M activities
- Key O&M related points of CA

Asset location and network

- The Asset starts at Moradabad (km 148.000) and ends at Bareilly (km 269.800) passing through districts of Moradabad, Rampur and Bareilly in Uttar Pradesh and having two ETC enabled toll plazas on the section of 121.8 km.
- It is a part of old NH24 (new NH9, NH530 and NH30) which mainly connects Delhi / NCR and north and north-eastern Uttar Pradesh and Uttarakhand in northern India. Both commercial and passenger traffic movement is being catered through the section.

Quantitative summary of physical features (1)

TRANSLINK® Infrastructure Consultants Pvt Ltd Smart Consulting

Quantitative summary of physical features (1)

Particulars	Details
Project Name	Four Laning of Moradabad-Bareilly Section of NH24 from km 148.000 to km 262.000 in the State of Uttar Pradesh under NHDP Phase III (Package No. NHDP – III/DL5/14) on DBFOT Basis
Length of the Asset	121.800 km
Service Road length	22.000 km
Lane Configuration	Four Lanes (except Rampur Bypass which is under construction for widening)
Length under O&M stage	118.820 km
Nos. of by passes and their total length	5 (Moradabad, Rampur, Milak, Fatehganj, Bareilly) Total 65.474 km
Nos. of ROBs	6 (at km 159.772, km 165.402, km 189.138, km 216.695, km 234.900, km 246.426)
Nos. of Major Bridges	7
Nos. of Minor Bridges	12

Quantitative summary of physical features (2)

Particulars	Details
Nos. of Culverts	170
Nos. of grade separator/fly over/interchanges	2 (at km 246.426, km 251.000)
Nos. of VUPs	11
Nos. of PUPs	22
Nos. of At-grade junction (major)	14

Key O&M related points of CA

Reference Article and Schedules of CA

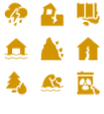
- Article 17 (Operation & Maintenance) and Schedule K (Maintenance Requirements) describe maintenance obligations of the concessionaire during O&M.
- Schedule K - Maintenance Requirements covers aspects like repair and rectification of defects and deficiencies, extension of time limit, emergency repairs/restoration, daily inspection by the concessionaire, divestment requirements and display of Schedule K at toll plazas.
- Further Article 18 to 23 adds specific obligations of the concessionaire during O&M, respectively Safety Requirements, Monitoring of O&M, Traffic Regulation, Emergency Medical Aid, Traffic Census and Sampling and Appointment of IE.

Operations

- **Regular Operations**
  - Smooth traffic flow
  - Functioning of toll system, lighting, patrolling, rescue & medical aid system, HTMS, O&M base camp, rest area, administrative building, truck lay byes, public toilet, portable water supply system, solid waste disposal system
  - Functioning of electric services at truck lay byes, bus bays and rest areas
- **Emergency Operations:** Accident/Incident Management

Maintenance

- **Regular Periodic Maintenance of Pavement:** Functional grade treatment to maintain roughness value of 2,500 mm/km
- **Routine Maintenance of Pavement** – Distress wise analysis with respect to performance criteria
- Routine and Periodic Maintenance of bridges and other structures, traffic signals, lighting, bus bays, control center, buildings, road furniture, landscaping



Special repair

- Damages occurring due to natural calamities like heavy floods, sand storms, hurricanes, cyclones, earthquakes to any element or system of the Asset

Chapter 3: Site visit and reconnaissance survey

- Main carriage way and service road
- Structures
- Toll plazas
- Other project facilities
- Field Investigations
- Site Visit Photographs during November 2023
- Observations on road safety

Main carriage way and service road

- Project road is four lane having paved width of 2 x 8.75 m along at grade section and 2 x 9 m at along built-up area. Approximately 40% of the pavement is in 'poor' condition based on visual observation during site visit. For these 40% poor locations, renewal work is in progress/completed. However, structural overlay has been proposed for these locations in MMR cycle of FY29 and FY30.
- 7 m width of service road was observed at built up area. 11.335 km of service road observed on each side. Pavement condition of service road is in fair to poor condition.

Main carriage way (km 158.000)

Bareilly bypass (km 237.100)

Service road (km 215.500)

Cracking (km 170.700)

Multiple distress (km 166.000)

Bleeding (km 245.900)

Source: TICPL site visit

Structures

- Pitching and Pier Protection work has been exercised for resistance against scouring for few of the major bridges.
- In general, drainage spout cover and elastomeric strip seals were found defective.

Major bridge (km 178.225)

ROB (km 189.200)

VUP (km 185.700)

Minor bridge (km 159.465)

Small vehicular under pass – under construction (km 185.000)

Source: TICPL site visit

Toll Plazas

- Toll plazas including administrative building, TMS are in order and complying project requirement.
- Rigid pavement at both toll plazas is in fair condition.

TP1 Niyamatpur (km 172.689)

Admin Building TP1 Niyamatpur

Toll collection equipment at TP1 Niyamatpur

TP2 Thriyakhetal (km 228.885)

Ambulance facility at Toll Plazas

Static weigh bridge at TP1 Niyamatpur

Source: TICPL site visit

Other project facilities

- Metal beam crash barrier observed along outer edge and RCC Crash barrier has provided over approach of GS Structure on top of RE Wall.
- Adequate road and safety signages are in place.

Road signages

Warning signages for accident zone

Hazard marking

Pedestrian guard rail (painting under execution)

Bus Bay

Crash barrier and safety measures during landscaping activities

Source: TICPL site visit

Field investigations

- Field investigations has been exercised with required safety measures and in due consultation with site officials.

Trial Pits

Pavement Condition Survey

FWD Survey

Source: TICPL site visit

Site Visit Photographs during November 2023 (1)

- Major maintenance work carried out from April 2023 to September 2023 was observed during site visit in November 2023.

Main carriage way (km 155.100)

Main carriage way (km 193.800)

Main carriage way (km 197.800)

Main carriage way (km 252.300)

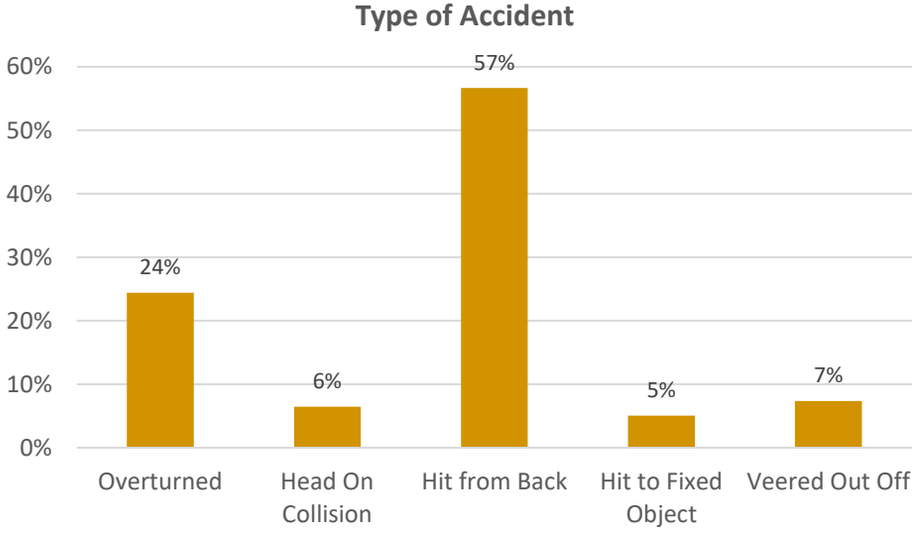
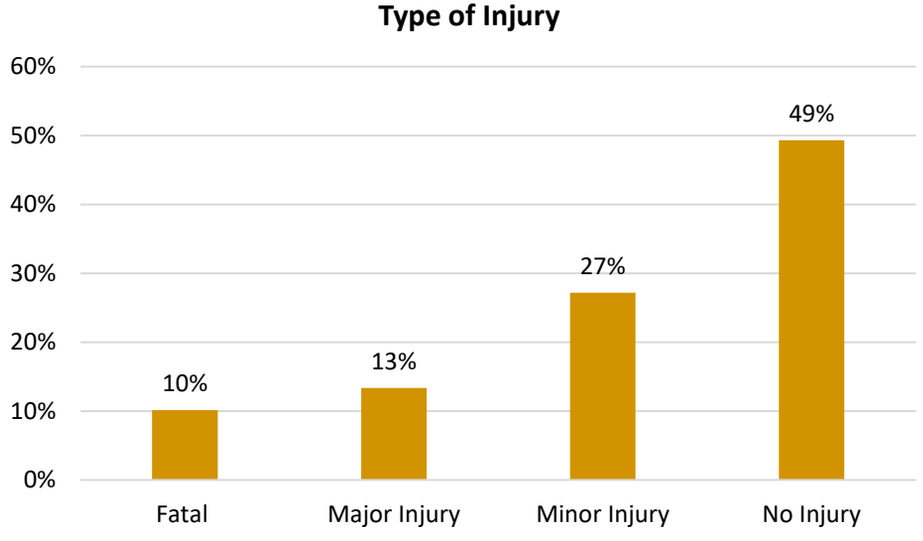
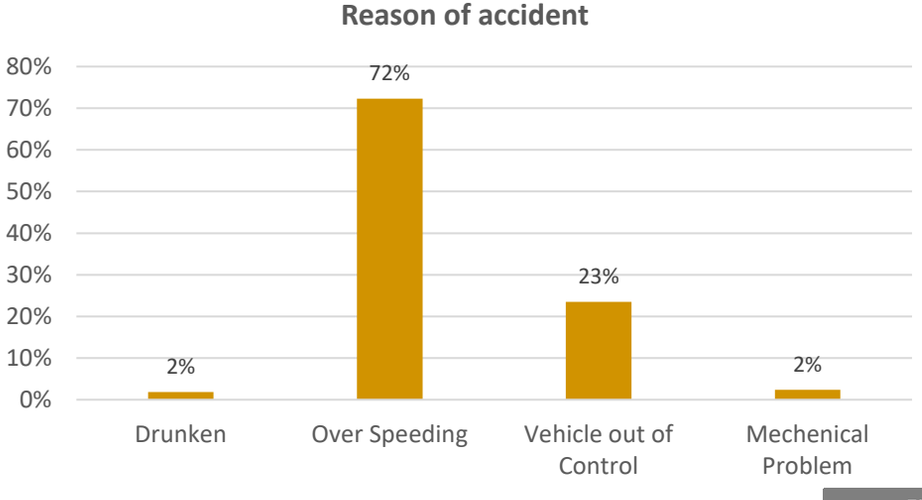
Observation on road safety (1)

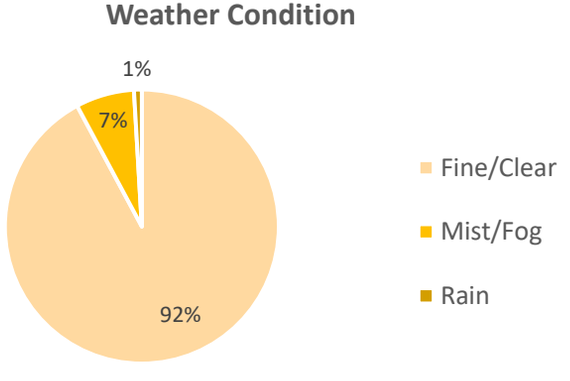
Historical accident data

- Based on reports made available for 5 months with respect to road safety, following facts are observed:
  - Nos. of accidents occurring during day time and night time are of equal proportions
  - Accidents occurring in rural areas are 2.7 times higher compared to urban area
  - 91% of accidents observed in straight section
  - 76% of accidents witnessed with victim age <40 years
  - In 87% of accidents were due to fault of driver









Observation on road safety (2)

Site observations

- 60% street lights were found non-operational
- Road marking and studs were not observed
- Reflectivity of signboards were found in order

Unauthorized access to MCW from SR (Nr. Fuel Station)

Unauthorized median break – Near 166 chainage

Moradabad City Junction identified as black spot

Source: TICPL site visit

Chapter 4: Condition assessment of structures

Condition assessment of structures

- All the major structures mentioned in the CA were found.
- Repair/Replacement of bearings, expansion joints, removal of vegetation, scour protection etc. activities are required at certain structures. Details of which are presented in this section..
- Visual inspections without MBIU includes:
  - Type of Structure, details of span, vent height etc.;
  - Conditions of substructure and super structure;
  - Conditions of expansion joints, bearings, drainage spouts etc.;
  - Type of protection work, if any.

- Most of the structures were found in sound condition and need only regular maintenance.
- However, a few structures requires attention as indicated in this chapter with select examples.

Select cases exhibiting condition of structure (1)

TRANSLINK® Infrastructure Consultants Pvt Ltd
Smart Consulting

Minor bridge (km 210+400)

- Construction joints are in fair condition
- Suitable repair to be considered

Minor bridge (km 268+220)

- Brick masonry wing wall and crash barrier (RHS)
- Suitable repair to be considered

Passenger Underpass (km 155+601)

- Raft requires repairing

Minor bridge (km 159+465)

- Wing wall (LHS) requires repairing

Source: TICPL site visit

Select cases exhibiting condition of structure (2)

- A few of the major bridges requires pitching and pier protection work for additional resistance against scouring.

Chapter 5: Condition assessment of pavement

Pavement evaluation

Performance of pavement under prevailing as well as future traffic and environmental situations is critical aspect to achieve expected economic returns from highway project. Estimating exact future O&M and Major Maintenance requirement is complex activity due to involvement of large number of variables.

For predicting performance of the pavement structure, following parameters are essential to analyse:

- Design of pavement layer thicknesses and configurations
- Material characteristics;
- Traffic condition;
- Present physical condition of the pavement layers;
- Local environment and its impacts;
- Probable modes of failure of existing pavement and
- Technology available for reconstruction.

Further, it is also necessary to presume level of performance and pavement condition will be considered satisfactory by all stakeholders.

This chapter exhibits outcome of field investigations and analysis carried out to find out the present condition of pavement followed by future course of repair/rectification/modification requirements for desired performance of pavement for balance concession period.

Review of pavement design report

Pavement for the project road has been proposed as per IRC: 37 - 2012. As per the Pavement Design Report received, following pavement has been adopted for MCW of the Asset:

Existing pavement configuration

Pavement layer	Thickness (mm)	Design life	MSA	Subgrade CBR
Bituminous Concrete (BC)	50	19 years for BT layer 23 years for GR layer	100	10%
Dense Bituminous Macadam (DBM)	130			
Wet Mix Macadam (WMM)	250			
Granular Sub-base (GSB)	200			
Selected Subgrade (10% CBR)	500

Source: *IE NSV Data February 2022 and* TICPL analysis

Based on major distresses such as Cracking, Rutting & Roughness, direction wise and lane wise pavement condition is summarized in table above.

Inferences:

- 35-40% of entire project road fall into poor condition*
- Except LHS inner, entire project road section has roughness higher than requirement of CA
- Entire project road has rutting greater than 5, this indicates weak sub base/subgrade. This can be further confirmed with NDT test results
- 50% of the project road section falls into good classification on account of cracking

**NSV data was of year 2022 and post that concessionaire has carried out rehabilitation activities in majority length of the project road. Hence, only structural analysis has been used to derive major maintenance strategy*.

Source: TICPL site visit and analysis

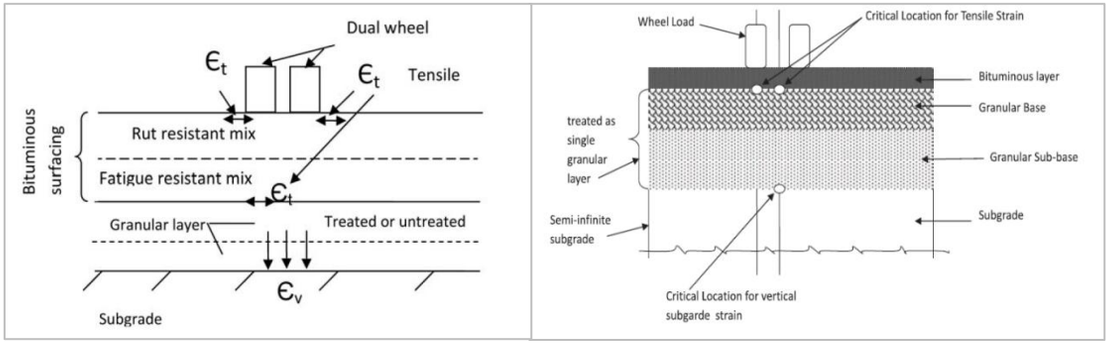
Based on major distresses such as Cracking, Rutting & Roughness, direction wise and lane wise pavement condition is summarized in table above.

Inferences:

- 14 km in LHS is in poor condition 32.7 km in RHS is in poor condition
- Cracking & Rutting were observed as major distress for both RHS & LHS

Structural assessment (1)

- FWD Deflection data was collected across the project road. Based on the deflection data and pavement crust thickness, Elastic modulus values of pavement layers were calculated and corrected for temperature and seasonality.
- Based on the homogeneity of these elastic modulus values of all pavement layers, entire project road was classified into several homogeneous sections. This was done to minutely isolate sections requiring specific rehabilitation treatments and to ensure that a particular section doesn't have any negative impact on entire homogeneous section because of 15th percentile design criteria
- For explanation purpose, approach is explained in table in next slide.
- Based on 15th percentile elastic modulus of these homogeneous section, using IITPAVE software, strains at critical locations i.e. bottom of BT & top of subgrade were calculated. With help of these strains Fatigue & Rutting residual lives of the homogeneous sections were calculated based on 90% reliability equations of IRC: 115 – 2014.
- If the residual life was less than design MSA, requirement of rehabilitation measure arise.



$N_f = 0.711 * 10^{-04} \times [1/\varepsilon_t]^{3.89} * [1/M_R]^{0.854}$ (90 per cent reliability)

$N = 1.41 \times 10^{-8} \times [1/\varepsilon_v]^{4.5337}$

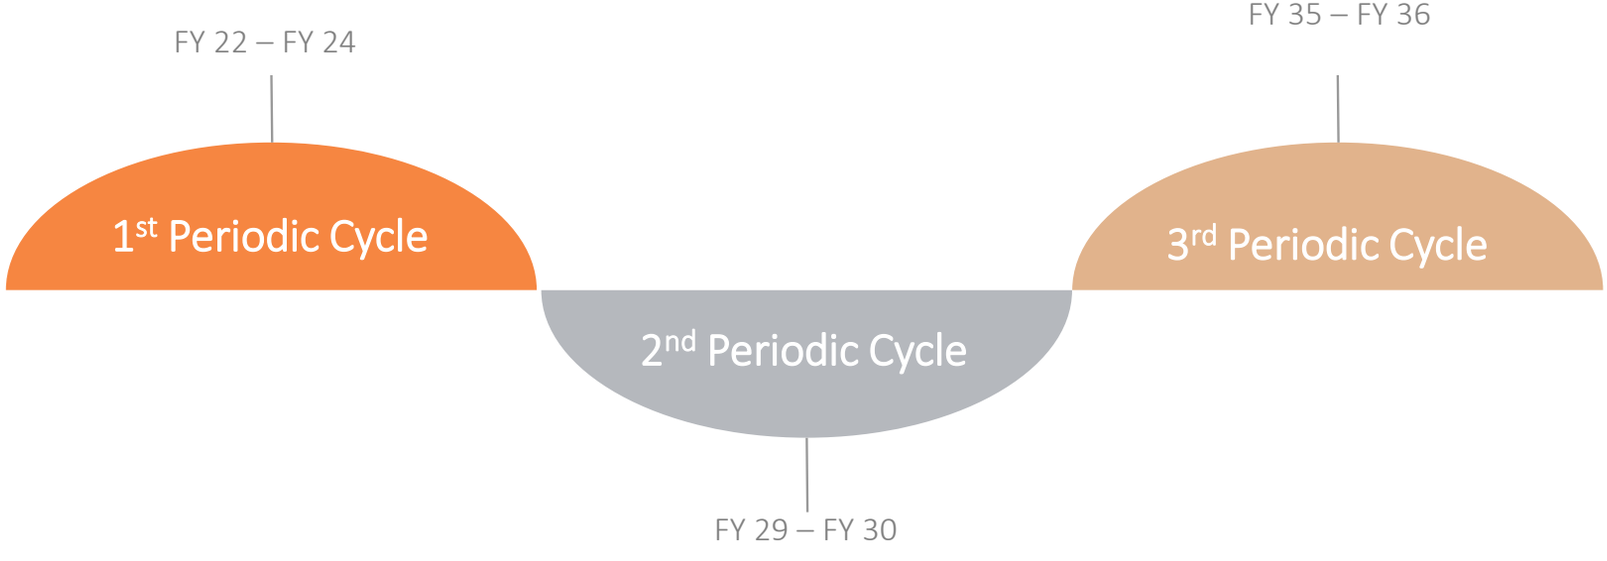
Major maintenance cycles (1)

Rehabilitation Strategy MCW

- As per CA, periodic major maintenance or function overlay is to be carried out whenever roughness exceeds 2500mm/km
- As per NSV data analysis majority of the section had roughness values above the threshold. However, these data was of year 2022 and post that concessionaire has carried out rehabilitation activities in majority length of the project road. Hence, only structural analysis has been used to derive major maintenance strategy.
- Maintenance Cycles – Given the fact that since FY 22 concessionaire had carried out rehabilitation activities, the next cycle for major maintenance has been considered in FY 29 – FY 30 & FY 35 – FY 36



Source:- Consultant's PCS 2023

Major maintenance cycles (2)

Rehabilitation Strategy MCW – 2nd periodic cycle

- To meet the functional roughness requirement of CA, entire project road section has been proposed to be overlaid with 40 mm BC layer
- Several homogeneous sections, where structural residual life was severely low, additional layer of required thickness of DBM is proposed with or without milling the existing BT layer. Wherever 15th percentile e-modulus of BT layer is observed to be on lower end, milling is proposed.
- Wearing coarse of Mastic Asphalt is considered on structures in addition to 40 mm BC

Rehabilitation Strategy MCW – 3rd periodic cycle

- To meet the functional roughness requirement of CA, entire project road section has been proposed to be overlaid with 40 mm BC layer
- Wearing coarse of Mastic Asphalt is considered on structures in addition to 40 mm BC

Other items

- Edge Line Marking, Center Line Marking, Median kerb Removing, New Median kerb installment are considered in both 2nd & 3rd periodic cycle

Rehabilitation Strategy Service Road – 1st periodic cycle

- 30 mm layer of BC overlay has been proposed on service road given the structural and functional condition of service road.

Rehabilitation Strategy Service Road – 2nd & 3rd periodic cycle

- Micro-surfacing has been proposed for entire length of service road in both the periodic cycles to meet the functional requirement of CA.

- *Client has already executed MMR activities worth 146.6 cr till September 2023. This costing includes 111 KM of overlay works in LHS and 119 Km of overlay works in RHS. 4cr of work of Bareilly bypass is pending. Hence, it has been considered in FY 24.
- $Client has already executed MMR work for service road worth INR 88 lakhs till September 2023. Total INR 84,59,781 is subtracted from BC overlay head for FY25. INR 375383 is subtracted from Tack coat head for FY25.
- # Costing of 3Cr has been considered for replacement of HPSV lights with LEDs from client's budget FY 25
- 5% escalation considered in rates of non-bituminous items & 3% for bituminous items
- Additional supervision fees of 2% of MMR cost shall be given to PMC

Source: TICPL estimate

- O&M cost for FY24 is considered for half year (from Sep'23 - Mar'24) only.
- 5% of escalation has been considered every year till the end of concession period.
- Concession period ends on 4th December 2036. Hence, O&M cost of FY 36 has been considered for 8 months and 4 days. However, concessionaire will get 3 months of extension due to covid pandemic
- Client has submitted the request for Construction of 3 flyovers on Bareilly bypass having estimated cost of INR 1.29 Cr has been requested under change of scope. However, approval is pending.
- Work completed by client under change of scope and its outstanding amount :
  - Drone video recording Sep', Oct' and Nov' 2021 - INR 3,04,086
  - Construction of Civil and Electrical Works of Oxygen Generation Plant at Rampur Hospital – INR 19,16,257
  - Implementation of Hybrid ETC System in all lanes of both plazas - INR 1,06,69,352

Annexure 2 : Pavement Deflection Data

Project Name:- Independent assessment of operating and maintenance requirements and major maintenance requirement - Moradabad Bareilly Expressway Limited

Name of the Road:	**Moradabad to Bareilly**	**Date and Time of the Observation:**	**27/04/2023 to 30/04/2023**
Section: RHS IN		**Section: RHS IN**	
No of lanes: 4 Lane			

S. No.	Side	Chainage	Air Temperature °C	Pavement Temperature °C	Load Drop No.	Peak Load Applied (KN)	Peak Deflection (mm) observed at a distance (mm) of

Annexure 2 : Pavement Deflection Data

Project Name:- Independent assessment of operating and maintenance requirements and major maintenance requirement - Moradabad Bareilly Expressway Limited

Name of the Road: Moradabad to Bareilly **Date and Time of the Observation:** 27/04/2023 to 30/04/2023

Section: LHS OT

No of lanes: 4 Lane

Annexure 2 : Pavement Deflection Data

Project Name:- Independent assessment of operating and maintenance requirements and major maintenance requirement - Moradabad Bareilly Expressway Limited

Name of the Road: Moradabad to Bareilly **Date and Time of the Observation:** 27/04/2023 to 30/04/2023

Section: RHS OT

No of lanes: 4 Lane

Annexure 2 : Pavement Deflection Data

Project Name:- Independent assessment of operating and maintenance requirements and major maintenance requirement - Moradabad Bareilly Expressway Limited

Name of the Road: Moradabad to Bareilly **Date and Time of the Observation:** 27/04/2023 to 30/04/2023

Section: LHS SH

No of lanes: 4 Lane

Annexure 2 : Pavement Deflection Data

Project Name:- Independent assessment of operating and maintenance requirements and major maintenance requirement - Moradabad Bareilly Expressway Limited

Name of the Road: Moradabad to Bareilly **Date and Time of the Observation:** 27/04/2023 to 30/04/2023

Section: RHS SH

No of lanes: 4 Lane

S. No.	Side	Chainage	Air Temperature °C	Pavement Temperature °C	Load Drop No.	Peak Load Applied (KN)	Peak Deflection (mm) observed at a distance (mm) of

Chapter 1: Introduction

- Assignment
- Scope of Work
- Approach and Methodology
- Data shared by the Client

Assignment and Scope of Work (1)

Sikar Bikaner Highway Limited (the "Client") is one of the road asset of Roadstar Infra Investment Trust which is Infrastructure Investment Trust (InvIT) established by the Infrastructure Leasing & Financial Services Limited (IL&FS). The Client has commissioned Translink Infrastructure Consultants Private Limited (the "Consultant" or "TICPL") to carry out independent assessment of operating and maintenance requirements and major maintenance requirements.

The Client owns Design, Build, Finance, Operate and Transfer (DBFOT) Toll road asset of 237.578 km covering Sikar – Bikaner section of NH11 in Rajasthan (the "Asset"). Total project cost was INR 650.84 crore.

The Consultant has submitted final report in May 2023. The client decided to get incremental due diligence in November 2023. Consultant has submitted final report of incremental due diligence in December 2023.

The client has again decided to get incremental due diligence in April 2024 to incorporate actual expenses of MMR work carried out in FY24 and rescheduling of balance MMR activities.

The revised final report includes the actual major maintenance costs incurred during FY24, the rescheduling of major maintenance activities initially budgeted for FY24 & FY25 to FY25, and major maintenance activities suggested by us for FY26.

Assignment and Scope of Work (2)

TRANSLINK® Infrastructure Consultants Pvt Ltd
Smart Consulting

Objective of the assignment

Reference discussion with the Client at proposal stage and during kick-off meeting, objective of the study is to incorporate actual expenses incurred during FY24 for major maintenance activities. Deliverables of this study is for internal consumption of the Client and no sharing of the deliverables with any third party for any other purpose is envisaged.

Scope of Work*

The broad scope of the work of this assignment is as follows:

- Review of the previously submitted technical due diligence report and RA bills of subcontractors provided by the client;
- Updating the technical due diligence report to reflect the actual expenses incurred during FY24 for major maintenance activities, as well as rescheduling the remaining major maintenance work and its associated costs to the next financial year.

*This assignment of incremental due diligence study expressly excludes any field surveys, site visits, or reconnaissance surveys. All findings and assessments are based solely on available data and documentation.

Approach and Methodology (1)

TRANSLINK® Infrastructure Consultants Pvt Ltd *Smart Consulting*

Approach

During the kick-off meeting, the Client preferred to have independent assessment by the Consultant before sharing their O&M strategy and O&M contracts in practice. Hence, the Consultant followed consultative and iterative approach from inception to address the need of the assignment.

Methodology

The Consultant reviewed documentation made available by the Client in piecemeal basis across the duration of the assignment, conducted reconnaissance survey of the Asset and undertaken field investigations to identify key aspects impacting asset quality, compliance to obligations of the Concession Agreement and adherence to safety standards.

To deliver the agreed scope of work and to meet the objective of the assignment, the study was divided into following four stages:

- **Stage 1: Review of documentation**
  - First tranche (pre-site visit) documentation i.e. Concession Agreement (CA) including schedules which define the requirements and obligations of Operation & Maintenance and limited monthly compliance reports of Independent Engineer, were studied to identify focus areas requiring site validation and detailed investigations in line with assignment objective.
  - Additionally, design and as-built drawings, CoS and PCOD documentation from reports prepared by Lender's Independent Engineer / Authority's Independent Engineer, limited field investigations reports of recent past (BI Test, NSV Report, Structure Condition Report) made available by the client were analysed for comparison with field surveys.
- **Stage 2: Site visit, asset inventory and visual condition assessment**
  - As-built drawings, requirements of facilities and furniture as per CA Schedule B were studied and list of items required to be verified during inventory surveys were identified.

  Outputs of these activities mainly includes:
    - Gaps in as-built asset and design drawings
    - Present condition of the Asset as per progress/compliance reports of Lender's Independent Engineer / Authority's Independent Engineer
    - List of pending works in case of pending items, ongoing maintenance work in FY24
    - Pending approvals and/or compliance comments from authority etc.

  Correlation of these two stages were considered to bring out critical areas for the subsequent stages of the review.

Approach and Methodology (2)

- **Stage 3: Field investigations**
  - Surveys and investigations were carried out to collect all the field data during April 2023.

List of field investigations conducted

Activity	Purpose	Output
Reconnaissance survey	Site appreciation	Asset characteristics
Inventory of roads, bridges and CD structures	Gap assessment against As Built	Inventory of the Asset
Visual inspection of Bridges without Mobile Bridge Inspection Unit (MBIU) and Visual Pavement Condition Survey (PCS)	Functional condition assessment	Probable rehabilitation measures and supporting role to conclusions derived from NDT, if any
Trial pits (every 15 km)	Identification of Crust thickness	Validation of Pavement Crust
Falling Weight Deflectometer (FWD) Test	Structural Condition of Pavement	Residual life of pavement

- **Stage4: Estimation of O&M, major maintenance requirement and OPEX projections**
  - Based on inputs from condition assessment and analysis of field investigation results, the Consultant arrived at one-time repair/rectification/modification requirement and associated cost as per obligations of CA in base year (FY24).
  - O&M / MM Requirement and OPEX estimate were based on the Consultant's independent analysis of pavement condition, structure condition and requirement for up-keep of road furniture, safety standards and requirement for hand-over stage (first-cut).
  - OPEX projections were determined during balance concession period based on rate analysis and in-house database of the Consultant.
  - First cut projections were optimized in line with the Client's O&M Strategy and cost optimization.

Input

- Identified gaps in context of Schedule B, C & D
- Defect liability period of ongoing work under EPC Contract if any
- Inferences from field investigation results
- Balance concession period as per CA
- Traffic projections provided by the Client
- Toll operations cost
- Rate analysis / Schedule of Rates
- Benchmarking exercise

Output

- **Major Maintenance Cycles for balance concession period**
- **Routine maintenance** (edge repair, crack sealing. patching, drainage)
- **Periodic and major maintenance** (preventive treatments, rehabilitation, pavement reconstruction)
- **Cost of operations** (toll, utility, manpower, incident management)

Data shared by the Client (1)

Chapter 2: Asset profile

- Location and network
- Key details of the Asset
- Concession timeline and key stakeholders
- Quantitative summary of physical features
- Present modality for O&M activities
- Key O&M related points of CA

Asset location and network

- The Asset starts at Sikar bypass (km 0.000 to km 19.463), NH11 & NH52 km 356.900 to km 557.775 and ends at Bikaner bypass (km 0.000 to km 17.240) and having four ETC enabled toll plazas. It is a part of NH11 and NH 52 which connects Jaipur and western part of Rajasthan.
- It passes through districts of Sikar, Churu and Bikaner and links Laxmangarh, Fatehpur, Ratangarh, Sri Dungargarh towns in Rajasthan.
- Sikar and Bikaner bypasses are two-laned with paved shoulder. Sikar-Bikaner section of NH11 has 168.585 km of two-laned with paved shoulder and 32.29 km of four-laned configuration.

Key O&M related points of CA

Reference Article and Schedules of CA

- Article 17 (Operation & Maintenance) and Schedule K (Maintenance Requirements) describe maintenance obligations of the concessionaire during O&M.
- Schedule K - Maintenance Requirements covers aspects like repair and rectification of defects and deficiencies, extension of time limit, emergency repairs/restoration, daily inspection by the concessionaire, divestment requirements and display of Schedule K at toll plazas.
- Further Article 18 to 23 adds specific obligations of the concessionaire during O&M, respectively Safety Requirements, Monitoring of O&M, Traffic Regulation, Emergency Medical Aid, Traffic Census and Sampling and Appointment of IE.

Operations

- **Regular Operations**
  - Smooth traffic flow
  - Functioning of toll system, lighting, patrolling, rescue & medical aid system, HTMS, O&M base camp, rest area, administrative building, truck lay byes, public toilet, portable water supply system, solid waste disposal system
  - Functioning of electric services at truck lay byes, bus bays and rest areas
- **Emergency Operations:** Accident/Incident Management

Maintenance

- **Regular Periodic Maintenance of Pavement:** Functional grade treatment to maintain roughness value of 2,500 mm/km
- **Routine Maintenance of Pavement** – Distress wise analysis with respect to performance criteria
- Routine and Periodic Maintenance of bridges and other structures, traffic signals, lighting, bus bays, control center, buildings, road furniture, landscaping

Special repair

- Damages occurring due to natural calamities like heavy floods, sand storms, hurricanes, cyclones, earthquakes to any element or system of the Asset

Chapter 3: Site visit and reconnaissance survey

- Main carriage way and service road
- Structures
- Toll plazas
- Other project facilities
- Field Investigations
- Site Visit Photographs during November 2023
- Observations on road safety

Main carriage way and service road

- Project road is two/four lane having paved width of 10 m in two lane section and 2 x 9 m in four lane section. Approximately 95% of the pavement is in 'Fair to Good' condition based on visual observation during site visit.
- 7 m width of service 1.133 km of service road observed on each side. Pavement condition of service road is in fair to poor condition.

Field investigations

- Field investigations has been exercised with required safety measures and in due consultation with site officials.
- Trial pits has been taken at every 15 km interval in staggered manner. Average 120 mm BT crust found in LHS and RHS, Average 200 mm and 215 mm crust in base course and sub base course in RHS. In LHS, average 200 mm and 225 mm base and sub base course found. Total average crust composition 530 mm.
- FWD survey was conducted as per IRC: 115 – 2014. Based on pavement condition, deflection data was collected. In 2 Lane section, for "Good" pavement condition, 4 points in a one kilometer section collected. In 4 Lane section, for "Good" condition, 12 points were collected.
- Day and night safety audit were conducted as per IRC: SP: 88 – 2019.

Chapter 4: Condition assessment of structures

Condition assessment of structures

- All the major structures mentioned in the CA were found.
- Repair/Replacement of bearings, expansion joints, removal of vegetation, scour protection etc. activities are required at certain structures. Details of which are presented in this section..
- Visual inspections without SBIU includes:
  - Type of Structure, details of span, vent height etc.;
  - Conditions of substructure and super structure;
  - Conditions of expansion joints, bearings, drainage spouts etc.;
  - Type of protection work, if any.

Select cases exhibiting condition of structure (1)

- All the structures were in sound condition and need only regular maintenance.

Proposed rehabilitation measures (1)

- Replacement of bearings and expansion joints to be considered as capital expenditure.
- For bearings and expansion joints, replacement cycle to be considered at 15 years from completion of construction year.

Chainage (km)	Type of structure	FY LHS	FY RHS	Replacement	Assumption for construction year

Chapter 5: Condition assessment of pavement

Base Year AADT (FY25)

Performance of pavement under prevailing as well as future traffic and environmental situations is critical aspect to achieve expected economic returns from highway project. Estimating exact future O&M and Major Maintenance requirement is complex activity due to involvement of large number of variables.

For predicting performance of the pavement structure, following parameters are essential to analyse:

- Design of pavement layer thicknesses and configurations
- Material characteristics;
- Traffic condition;
- Present physical condition of the pavement layers;
- Local environment and its impacts;
- Probable modes of failure of existing pavement and
- Technology available for reconstruction.

Further, it is also necessary to presume level of performance and pavement condition will be considered satisfactory by all stakeholders.

This chapter exhibits outcome of field investigations and analysis carried out to find out the present condition of pavement followed by future course of repair/rectification/modification requirements for desired performance of pavement for balance concession period.

Review of pavement design report

Pavement for the project road has been proposed as per IRC: 37 - 2012. As per the Pavement Design Report received, following pavement has been adopted for MCW of the Asset:

Existing pavement configuration

Pavement layer	Thickness (mm)	Design life	MSA	Subgrade CBR
Bituminous Concrete (BC)	40,45	23 years for BT layer 23 years for GR layer	39-73	15%
Dense Bituminous Macadam (DBM)	65 / 70 / 75			
Wet Mix Macadam (WMM)	250			
Granular Sub-base (GSB)	200			
Selected Subgrade (10% CBR)	500

Visual Condition	No. of 100mt. section
Fair to Good	1,134
Fair	1,135
Fair to Poor	14
Poor	36

RHS

Visual Condition	No. of 100mt. section
Fair to Good	1,121
Fair	1,157
Fair to Poor	28
Poor	24

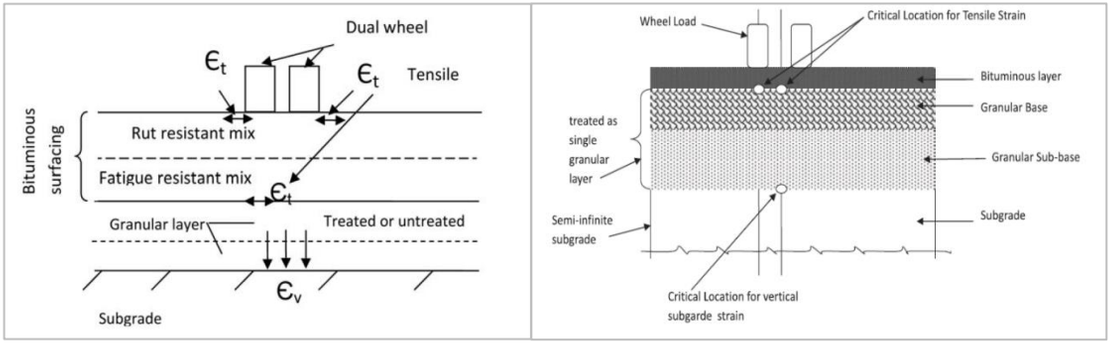
Source: TICPL site visit and PCS

- Sikar Bypass section was observed in Fair to Good condition in both direction apart from few exceptions. These sections had Alligator cracks as major distress.
- 356.000 km – 374.700 km, 4 Lane sections had considerable sections under rutting and severe cracking on both directions. Patchwork and Micro-surfacing work was observed in some sections during PCS.
- 9.000 km – 17.000 km, part of Bikaner Bypass section was in distress condition including several sections of severe cracks and minor ruts and patch work. Condition of pavement near ROB location was in poor condition.

Structural assessment (1)

Structural Condition of Pavement

- FWD Deflection data collected was collected across the project road. Based on the deflection data and pavement crust thickness, elastic modulus values of pavement layers were calculated and corrected for temperature and seasonality.
- Based on the homogeneity of these elastic modulus values of all pavement layers, entire project road was classified into several homogeneous sections. This was done to minutely isolate sections requiring specific rehabilitation treatments and to ensure that a particular section doesn't have any negative impact on entire homogeneous section because of 15th percentile design criteria
- Based on 15th percentile elastic modulus of these homogeneous section, using IITPAVE software, strains at critical locations i.e. bottom of BT & top of subgrade were calculated. With help of these strains Fatigue & Rutting residual lives of the homogeneous sections were calculated based on 90% reliability equations of IRC: 115 – 2014.
- If the residual life was less than design MSA, requirement of rehabilitation measure arise.



$N_f = 0.711 * 10^{-04} \times [1/\varepsilon_t]^{3.89} * [1/M_R]^{0.854}$ (90 per cent reliability)

$N = 1.41 \times 10^{-8} \times [1/\varepsilon_v]^{4.5337}$

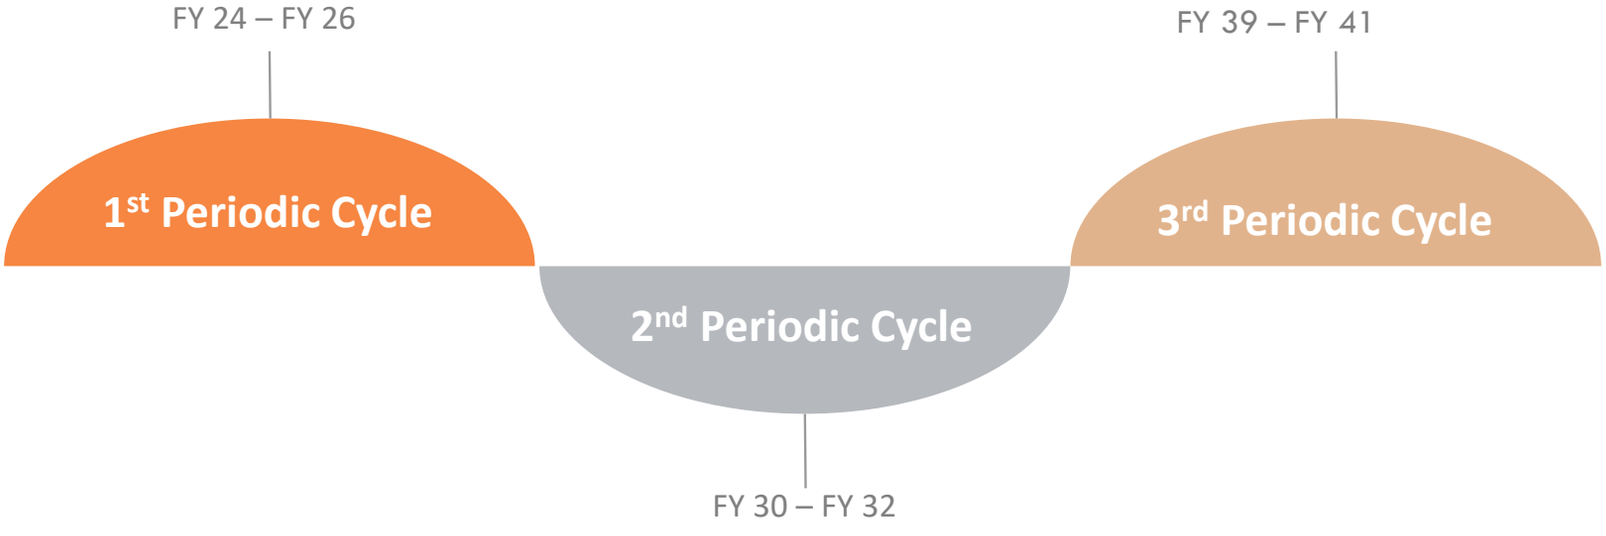
Chapter 6: Major maintenance cost estimate

Major maintenance cycles (1)

Rehabilitation Strategy MCW

- As per CA, periodic major maintenance or function overlay is to be carried out whenever roughness exceeds 2000mm/km
- As per roughness data and PCS observation, majority of the section has roughness values below the threshold. Hence, only structural analysis has been used to derive major maintenance strategy.
- Maintenance Cycles – Given the fact that since FY 22 concessionaire had carried out rehabilitation activities, the next cycle for major maintenance has been considered in FY 24 – FY 26 , FY 30 – FY 32 & FY 39 – FY 41



Source: - Consultant's PCS 2023

Major maintenance cycles (2)

Rehabilitation Strategy MCW

- Homogeneous sections where residual life of the pavement was not sufficient enough in comparison to design MSA of next periodic maintenance cycle, rehabilitation measure such as overlay by BC or BC & DBM both as per the requirement assessed. In sections where elastic modulus of BT was very low, milling treatment is provided before carrying out rehabilitation measure.
- Homogeneous sections where residual life of the pavement was sufficient enough for full design MSA, micro surfacing treatment is proposed in each cycle with/without 40 mm BC functional overlay in last cycle as per requirement

Rehabilitation Strategy Service Road

- Wearing coarse of Mastic Asphalt is considered on structures in addition to 40 mm BC
- Edge Line Marking, Center Line Marking, Median Kerb Removing, New Median Kerb installment are considered in each periodic cycle

- 30 mm layer of BC overlay has been proposed on service road given the structural and functional condition of service road, both in 2nd & 3rd periodic cycle.

Source: TICPL estimate

- 5% escalation considered in rates of non-bituminous items & 3% for bituminous items
- Client has already floated/shall float the tender for some major maintenance work from budget INR 60.6 Cr which is to be executed in FY 25.
- Based on actual data, MMR work started in FY23 & only 3 crore worth of work was executed in FY24. The MMR work proposed by the consultant for FY24-25 has been deferred to FY26. The client will proceed with executing the major maintenance work outlined in the FY24-25 budget.

Chapter 7: O&M cost estimate

O&M cost estimate

To derive Operation and maintenance cost, it has been sub headed into Routine Maintenance, Toll Plaza operation, Corridor Control/Patrolling /Incident Management Expanses, Insurance Policy charges and IE Fees.

Routine Maintenance

- Routine maintenance can be further divided into various components like roads, roadside, traffic services, drainage, plantation, bridges and structures, toll plaza/Rest area, electrification.
- Routine Maintenance includes pavement repair works for various defects like pothole, cracks, rutting, bleeding, skidding, raveling, stripping, pavement edge drops, etc., cleaning of main carriageway and service road, repairing of hard shoulders, footpath repairs, cleaning and maintenance of road furniture, drainage, plantation, bridges and other CD structures, maintenance of street lighting, etc.
- Costing related to all above mentioned activities shall be considered in this head.

Toll Plaza Operation

- It includes toll plaza staff salaries, maintenance of toll collection system, toll plaza and corridor electricity charges, cash handling charges and other misc. items i.e. printing, stationary, etc.

Corridor Patrol & Incident Management

- It includes operation and management cost of personnel and vehicles involved in route patrolling and management of road accidents, breakdowns and other emergencies.

Insurance

- It includes premium of covers under IAR, insurance of road and toll plaza building, road furniture, premium of EEI and money policy, terrorism cover of SPV offices, comprehensive general liability

IE Fees

- Independent Engineer's fees

Annexure 2 : Pavement Deflection Data

Project Name:- Consultancy Services for independent assessment of operating and maintenance requirements and major maintenance requirement - Sikar Bikaner Highways Limited

Name of the Road: Sikar to Bikaner | **Date of the Observation:** 23/04/2023 to 25/04/2023

Section: RHS IN | **Season of Test: Summer**

No of lanes :

Annexure 2 : Pavement Deflection Data

Project Name:- Consultancy Services for independent assessment of operating and maintenance requirements and major maintenance requirement - Sikar Bikaner Highways Limited

Name of the Road: Sikar to Bikaner **Date of the Observation:** **23/04/2023 to 25/04/2023**

Section: RHS **Season of Test: Summer**

No of lanes : 2 lane

Annexure 2 : Pavement Deflection Data

Project Name:- Consultancy Services for independent assessment of operating and maintenance requirements and major maintenance requirement - Sikar Bikaner Highways Limited

Name of the Road: Sikar to Bikaner | **Date and Time of the Observation:** 23/04/2023 to 25/04/2023

Section: LHS | **Season of Test: Summer**

No of lanes :

FWD Standard Methodology

- **General**

Consultant has undertaken FWD survey for preparing pavement design for project road. The proper improvement measures for existing pavement and better performance of project road up to design life depends upon precisely done structural evaluation.

Falling weight Deflectometer survey for structural evaluation of the existing in-service pavement.

- **Falling Weight Deflectometer Survey**

Consultant conducted Falling Weight Deflectometer (FWD) survey throughout the project road to evaluate the in-service performance of the existing pavement. This was required to carry out structural evaluation of in-service pavements in order to determine the thickness of strengthening layers on existing payment as per procedures described in IRC: 115-2014 and it is one of the key objective of study.

Falling weight Deflectometer (FWDs) have been in use since the 1980s. These devices are used to measure pavement deflections in response to a stationary dynamic load, similar to a passing wheel load. The data obtained are used to evaluate the structural capacity of pavements for research, design, rehabilitation, and pavement management purposes. The interpretation of FWD data is a key method for estimating the in situ moduli of pavement layer materials.

Falling Weight Deflectometer is an impulse-generating device with a guide system. This device allows a variable weight to be dropped from a variable height. The apparatus has a loading plate which is used for uniform force distribution on the test layer. When the weight affects this plate, this loading plate ensures that the resulting force is applied perpendicularly to the test layer's surface. It also has a load cell for measuring the actual applied impulse. It also has one or more deflection sensors. (Note: Deflection basin tests require at least seven sensors.) It also has a system for collecting, processing, and storing deflection data.

The basic working principle of the impulse loading equipment is to drop a mass on the pavement to produce an impulse load and measure the surface deflections. The mass is dropped on a spring system, which in turn transmits the load to the pavement through a loading plate. The resulting deflection bowl characteristics are observed and used in the Back calculation of pavement material properties. The principle for FWD is illustrated in below figure:

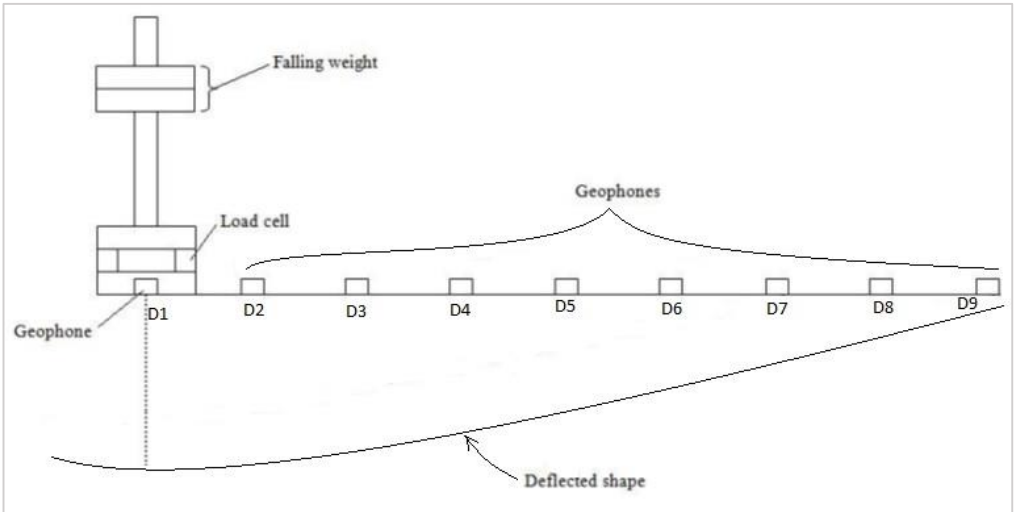

Figure: Working Principle of FWD

Falling Weight Deflectometer (FWD) is extensively used world-wide because it simulates, to a large extent, the actual loading conditions of the pavement. When a moving wheel loads passes over the pavement it produces load pulses. Normal stresses (vertical as well as horizontal) at a location in the pavement will increase in magnitude from zero to a peak value as the moving wheel load approaches the location. The time taken for the stress pulse to vary from zero to peak value is termed as 'rise time of the pulse'. As the wheel moves away from the location, magnitude of stress reduces from peak value to zero. The time period during which the magnitude of stress pulse varies from 'zero-to-peak-to-zero' is the pulse duration. Peak load and the corresponding pavement responses are of interest for pavement evaluation. The resulting load-deflection data can be interpreted through appropriate analytical techniques, such as back calculation technique, to estimate the elastic moduli of the pavement layers. The computed moduli are, in turn, used for (i) the strength evaluation of different layers of in-service pavements (ii) the estimation of the remaining life of in-service pavement(iii) determination of strengthening requirement, if any and (iv) evaluation of different rehabilitation alternatives (overlay, recycling, partial reconstruction, etc.).

Dynatest Heavy Weight Deflectometer (HWD) Test Model 8082 was used to generate the requisite NDT load-deflection data that is analysed in this report. Fundamentally, the HWD generates a transient, impulse-type load of 25-30 msec duration, at any desired (peak) load level between 30 and 240 KN, thereby approximating the effect of a moving wheel load. A more complete description of the HWD Test System used for this project is given below.

- **Main Component of Dynatest Model 8082 HWD**

The main components of the Dynatest Model 8082 HWD system are described in the following paragraphs.

Vehicle

A vehicle was suitably modified to incorporate operating requirements of FWD system including hydraulic and electronic circuits. Modifications were made in the vehicle to accommodate necessary furniture for personal computer, electronic circuits and for working personnel. An alternator was used to draw power from the engine of the vehicle for charging the batteries. Sine wave inverter was used to supply power to the computer and the electronic circuit. The vehicle is equipped with flashing lights to caution the road users during the test.

Load Cell

Load cell is mounted directly on the top of the loading plate measures the load applied to the pavement surface. Load cell accuracy is $\pm$ 1 %.

Loading Plate Assembly

A universal joint is fixed at the bottom of top plate of the assembly to provide flexibility and to ensure that the loading plate rests evenly on the pavement surface. A casing was made to hold the central geophone. The loading plate assembly consists of a bottom plate of 300 mm dia with a rubber sole fixed to its bottom for uniform distribution of load.

Load Pulse

A single-mass falling weight/buffer subassembly system is furnished which directly transfers the full energy of the single falling mass to the loading plate through the proper configuration of buffers to achieve a loading time of 25 to 30 msec, for any falling mass and drop height. This loading system is hydraulically operated and designed so, that at least, four different configurations of mass and rubber buffers may be employed. All mass configurations produce a transient load pulse approximately half sine wave formed and 25 to 30 msec in duration, with a rise time of 10 to 15 msec for any falling height (for all loads). If load pulse duration of 20-50 msec is required, this can be obtained by using specific weight buffer configuration.

This arrangement best simulates the on field creation of load pulse and hence the deflection bowl.

Geophone Arrangement

Nine geophones are arranged in a geophone frame at radial distances of 0, 200, 300,450, 600, 900, 1200, 1500 and 1800 mm from the centre of the loading plate to measure the pavement surface deflections. The geophones measure the velocity of the pavement during deflection and the deflections are obtained by integration of the recorded signals.

Time Histories

- Time histories are collected for the load signal and all 15 deflection channels in a time window ranging from 40 to 200 msec
- The system is capable of storing histories for up to 400 msec when the data is required for special research needs and for undertaking dynamic analysis.
- Sampling circuit can scan each of the channels in 0.05 msec intervals independent of the number of channels in use.

Accuracy

Equipment accuracy remains stable and verification is not required on a frequent basis (regardless of type of test sites, changes in deflector distances, etc.) On-going user verification of original guaranteed deflection specifications is provided in the form of a relative/dynamic field calibration verification procedure in which a minimum of nine (9) of the deflectors are placed into a mechanical columnar device to obtain comparative relative calibration verification of the deflectors at any distance from the load up to a distance of at least 2.5 meters (8 ft) to ensure that all deflectors give the same data output within specification tolerances, at large as well as small deflection levels, and both close to and far from the loading plate under actual HWD loading conditions.

Figure: Falling Weight Deflectometer (FWD) Machine

Moreover, this particular instrument mostly exceeds and matches all the criteria given in the IRC: 115 - 2014. Following Table summarizes the technical specifications of the instrument.

Table: Comparison between Dynatest HWD 8082 and IRC Specifications

Sr. No.	FWD Components	IRC Recommended Specification for FWD	Dynatest HWD 8082 Specification	Remarks
1	Plate Diameter	300/450mm	300 mm	In IRC:115-2014, 300 mm dia plate is recommended
2	Mass System	Single Mass	Single Mass	Matched
3	Falling Weight Mass	50 to 700 Kg		To produce standard axle wheel load of 40 KN , falling weight mass and height of fall will be adjusted automatically
4	Height of fall	100 to 600 mm	Variable	Matched
5	Target Peak Load	40 KN	40 KN	Matched
6	Load Pulse Time	15 – 50 ms	20 -50 ms	Matched
7	Pulse Rise Duration	Nil	10- 15 ms	No information is given in IRC on pulse rise duration
8	Load Cell Accuracy	± 2 %	± 1 %	Matched
9	Number of Deflection Transducers	6 to 9	9	Matched
10	Deflection Sensor Types	Geophones	Geophones	Matched
11	Reading Resolution of Deflection Transducers	Min 1 um	1 Micron	Matched
12	Deflection Transducers Accuracy	± 2 %	± 1 %	Matched

- **Calibration Requirements**

Static calibration of Load Cell

The load cell(s) used in the FWD are calibrated in a standard laboratory and the readings of the load cell(s) matched to those of the reference load cell. The readings of the FWD load cell were accurate to 2 percent of the reference load cell readings. Dismounted deflection transducers were also calibrated in a laboratory setup following any approved procedure and the deflection transducers were also accurate to 2 percent of reference deflections.

Repeatability Test

In order to study the consistency and accuracy of the test results obtained by FWD, load repeatability test was done before using the FWD. In this test, deflection and load data were measured for selected load is dropped from desirable height and which was carried out on a level bituminous pavement surface, which did not have any cracks. The range of load applied was taken in such a way that it generated peak central deflections in the range of 250 µm to 600 µm. The test was repeated for a minimum of twelve times. The standard deviation of the peak load in the load repeatability test estimated was less than 5 percent of the mean value of peak load which was achieved in the load repeatability test. Deflection repeatability check was also conducted using the data collected in load repeatability test. The standard deviation of the normalized deflections, were also less than 5% of the mean value of reading. Results of repeatability tests conducted on project site before start of surveys are shown in below table.

Table: Load Repeatability Test Results

Drop No.	1	2	3	4	5	6	7	8	9	10	11	12

- **Deflection Test Scheme**

Deflection measurement scheme adopted for the section of 4 & 6 lane carriageway is given in below Table**.**

Table: Deflection Measurement Scheme (IRC: 115-2014)

Type of Carriageway	Recommended Measurement Scheme	Maximum Spacing for Test points along selected wheel path for pavements of different classification		
		Poor	Fair	Good
Four-lane Dual (divided) carriageway (Measurement scheme given for each carriageway)	Measure along outer wheel path of Outer lane	30	65	250
	Measure along outer wheel path of Inner lane	60	130	500
	Measure along the centre line of the paved shoulder (in case of widening projects)	120	260	500
Dual carriageways with 3 or More lanes in each direction (Measurement scheme given for each carriageway)	Measure along outer wheel path of Outermost lane	30	65	250
	Measure along outer wheel path of more distressed Inner lane	60	130	500
	Measure along the centre line of the paved shoulder (in case of widening projects)	120	260	500

Based on the pavement condition survey analysis and classification of pavement condition spacing between test points was finalized according to the above given Table and as per the latest guidelines of IRC: 115-2014. In all the project road, Pavement condition is assumed as fair and deflection data were taken at every 250 m for two lane road.

- **Deflection Data Collection**

The following steps were followed for measuring deflections at each test point.

(i) Equipment is positioned over the test location in such a way that the loading plate is positioned directly above the identified location and there was no standing water (surface texture completely filled with water) on the pavement surface.
(ii) Geophone frame was straightened and brought down to the pavement surface so that the probes of the geophones touch the ground. The loading plate was pressed against the pavement until the wheels of the vehicle get lifted up slightly from the ground.
(iii) The mass of the FWD was raised to the desired height and the loading plate assembly was lowered to the ground.
(iv) The mass was dropped.
(v) The mass was raised, held in position and dropped again. This process was repeated three times to ensure conditioning of the test location.
(vi) The data acquisition software was initialized with appropriate configuration.
(vii) The mass was dropped and the signals from load cell and geophones were recorded in the laptop.
(viii) The data was processed to determine the magnitude of the applied load and the surface deflections at different radial distances.
(ix) The height was adjusted in such a way that the amplitude of the impulse load is closet 40 KN.
(x) At each location, the load was dropped three times and data was recorded.

Checks performed on the Deflection Data

- Deflections should decrease with increasing distance from the loading plate.
- Deflection values should not be more than the capacity of the sensors.

Asphalt temperature at 40 mm depth from the surface of pavement was measured at an interval of every 30 minutes by digital thermometer. Figure shows the deflection data collection activity on project road.

Figure: FWD Data Collection on field

Raw deflection data are normalized at 40 KN for the overlay analysis purpose.

- **KGPBACK Computer Program & Back Calculations of E Moduli**

This section describes the salient features of the GA based program - KGPBACK developed for back calculation of layer moduli of each pavement layer from measured deflection basins. The flow chart for this algorithm is presented in below Figure

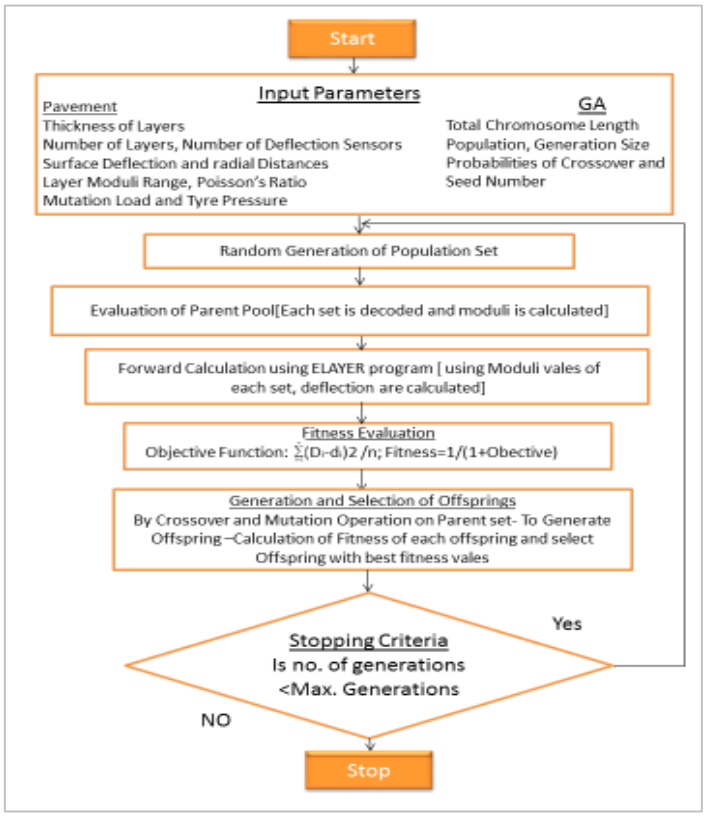

Figure: Flowchart for KGPBACK

KGPBACK program has been developed keeping in view the general features of the FWD developed in the investigation. The program does not back calculate Poisson's ratio and thicknesses. Normally typical values of Poisson ratio values are selected for the analysis as Poisson ratio values, when chosen within practical range; do not have significant influence on the deflections. Similarly, thicknesses of different layers are also assumed to be known. The typical objective function normally used in the case of back calculation analysis is the minimization of the sum of the squared differences of calculated and measured deflections. Ranges of different layer moduli are to be given as input to KGPBACK for back calculation. The following ranges of moduli are taken for different layers for carrying out back calculation using KGPBACK.

Bituminous Layer Moduli Ranges as per IRC:115-2014

By the detailed pavement condition survey, if Pavement condition is good, **Adopted Lower Range: - 750 Mpa** and **Upper Range: 3000 Mpa** and if Pavement condition are fair to poor, **Adopted Lower Range: - 400 Mpa** and **Upper Range: 1500 Mpa.**

Granular Layer as per IRC:115-2014
Adopted Lower Range: - 100 Mpa
Adopted Upper Range: - 500 Mpa
The subgrade moduli range is chosen based on the below method
$E_{Subgrade}$ = (1-μ^2)*P/ (3.14*r*w) (IRC: 115-2014 Equation no. III.2)

Where,
E_subgrade = backcalculated modulus of subgrade (Mpa)

DCP = Dynamic Cone Penetrometer value (mm/blow)

Consultant has adopted worst case subgrade E ranges based on above equation due to higher ranges of subgrade with Eqn. (III.2) and other methods of IRC: 115-2014.

Crust composition mentioned in above section was also an input parameter for KGPBACK. However, it was observed that sand was part of Granular layer at certain instances. For safe and conservative design, thickness of sand has been eliminated while considering the crust thickness as input for KGPBACK. The input values including E moduli range and layer thickness of KGPBACK input screen which was shown in below Figure.

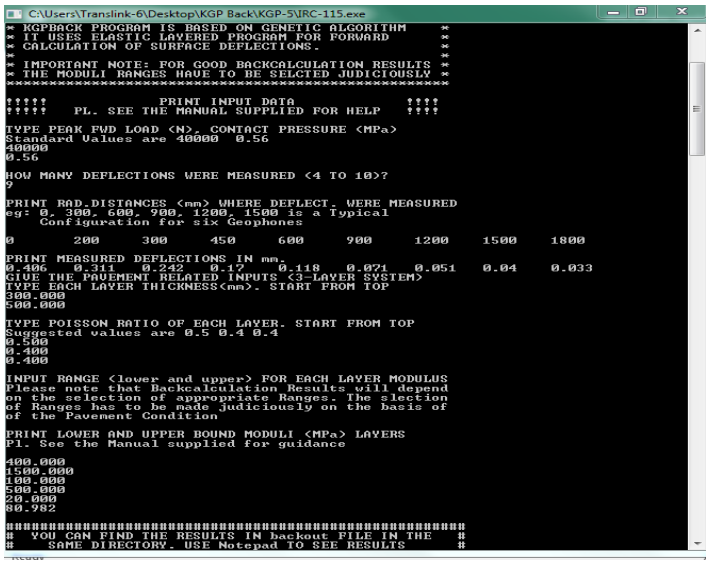

Figure: KGPBACK input Screen

- **Result of E Moduli for Pavement Layers**

The E moduli values were calculated at each test points of FWD using KGPBACK program considering the normalized deflection data. The back calculated moduli are used for the analysis of the in-service pavement and for assessment of the structural condition of the pavement. KGPBACK, which is a specific version of BACKGA program developed by the Transportation Engineering Section of IIT, Kharagpur. The E moduli values of each layer is the most important factor that affects the overall design of the pavement. E moduli values were corrected for temperature and seasonal variation which is further used for estimation of the design E moduli values.

- **Temperature Correction of Bitumen Layer**

Back calculated moduli values of the bituminous layers evaluated by FWD survey are influenced by the pavement temperature. Hence, the back calculated moduli obtained at temperatures other than the identified standard temperature would have to be corrected for a standard temperature of 35 degree Celsius. For areas in India having a tropical climate, the standard pavement temperature is recommended as 35°C. The bituminous layer modulli are corrected for a standard temperature of 35°C for each test points having temperature other than 35°C.

$$E_{T1} = \lambda E_{T2}$$

$$\lambda = \frac{1 - 0.238 \ln T_1}{1 - 0.238 \ln T_2}$$

Where, Lemda is a correction factor

Where, E_{T1} = Back calculated modulus (MPa) at Temperature T_1 (degree Celsius)

Where, E_{T2} = Back calculated modulus (MPa) at Temperature T_2 (degree Celsius)

- **Correction for Seasonal Variation - Non Bitumen Layer**

Moisture content affects the strength of subgrade and granular sub base/base layers. It is intended that the pavement layer moduli values should pertain to the period when the subgrade is at its weakest condition. In India, this period occurs during the recession of monsoon. It is, therefore, desirable to conduct deflection measurements during this period. Where the same is not feasible, a correction procedure should be adopted. Since the deflection data was collected during winter season, the winter correction factor has been applied for granular sub base/base and subgrade layer.

Seasonal correction factor for the Granular layer

$$E_{gran_Mon} = 10.5523 * (E_{gran_win})^{0.624} - 113.857$$

Where,
E gran_mon = Granular layer Modulus in Monsoon (MPa)
E gran_win = Granular layer Modulus in winter season (MPa)

Seasonal correction factor for the Subgrade layer

$$E_{sub_mon} = 3.351* (E_{sub_win})^{0.7688} - 28.9$$

Where,
E sub_mon = Subgrade Modulus in Monsoon (MPa)
E sub_win = Subgrade Modulus in winter season (MPa)

Annexures 4: O&M cost estimate

Routine Maintenance

Item No	Item Head	Description	Frequency	Unit (per annum)	Qty	Rate	Amount per year, INR	Remarks
1	**ROADS**	**28.8%**						
1.1		Roughness Value (BI Test)	2 X Annually	Lane Km	541.2	2,000	10,82,400	BI test twice a year | Rs 1000/- per lane km
1.2		Pothole / Patchwork						
		Main Carriage way	Upon Occurrence	Sqm	13202	332	43,83,064	0.5% Per Km Per Year | 1 Km Area = 10000 M² for 2 lane & 17500 M² for 4 lane| Rs 332/- Per Sqm
		Service Road	Upon Occurrence	Sqm	79	332	26,331	0.5% Per Km Per Year | 1 Km Area = 7000 M² | Rs 332/- Per Sqm
1.3		Cracks Sealing						
		Main Carriage way	Upon Occurrence	Sqm	26404	47	12,40,988	1% Per Km Per Year | 1 Km Area = 10000 M² for 2 lane & 17500 M² for 4 lane| Rs 47/- Per Sqm
		Service Road	Upon Occurrence	Sqm	159	47	7,455	1% Per Km Per Year | 1 Km Area = 7000 M² | Rs 47/- Per Sqm
1.4		Other Defects (Rutting, Bleeding / Skidding, Ravelling / Stripping, Pavement Edge Repairs)						
		Main Carriage way	Upon Occurrence	Sqm	13202	85	11,22,170	0.5% Per Km Per Year | 1 Km Area = 10000 M² for 2 lane & 17500 M² for 4 lane| Rs 85/- Per Sqm
		Service Road	Upon Occurrence	Sqm	79	85	6,741	0.5% Per Km Per Year | 1 Km Area = 7000 M² | Rs 85/- Per Sqm
1.5		Road Sweeping /Cleaning (MCW /SR)						
		Urban	Daily	Km-month	215	3,349	7,20,978	Total 17.941 Km of urban section. Rental and operating cost of 1 broomer is considered. Broomer works with efficiency of 10 km/hr for 6 hr.
		Rural	Daily	Km-month	2245	529	11,87,845	Total 6 labours for cleaning work of MCW of rural section | Labour wages - Rs 550/-
						Total Cost for Roads	**97,77,973**	
2	**ROADSIDE**	**9.3%**						
2.1		Blading/grading the unpaved shoulder and slopes using motor grader at the required camber /Repairing Hard/Earthen Shoulders/Side Slopes (Edge Drops)	2-3X Annually	Sqm	13192	120	15,82,985	1.5% Per Km Per Year | 1 Km Area = 2000 M² | Rs 120/- Per Sqm
2.2		Rain Cuts / Gullies in Slopes	2-3X Annually	RM	10000	152	15,24,390	10 Km of Rain cuts maintenance work considered annually
2.3		Foothpath / Sidewalk repairs	Upon Occurrence	Sqm	269	240	64,588	0.5% Per Km Per Year | 1 Km Area = 7000 M² | Rs 240/- Per Sqm
						Total Cost for Roadside	**31,71,962**	
3	**TRAFFIC SERVICES (Road Signs & Pavement Marking)**	**35.4%**						
3.1		Traffic Signs -(Informatory / Direction/Hazard Marker/ Gantries)						
		Routine Maintenance	Monthly	No-month	6000	165	9,90,000	Total 5 labours for cleaning work of sign boards | Labour wages - Rs 550/-
		Replacement	Upon Occurrence	No.	400	4,900	19,60,000	Replacement of total 400 TS per year |Rs. 4900/- per nos.
3.2		Pedestrain Guardrail Repair						
		Cleaning, clearing of dirt, routine maintenance	Monthly	RM-month	474	2,089	9,89,499	Total 5 labours for cleaning work of PGR| Labour wages - Rs 550/-
		Replacement	Upon Occurrence	RM	200	1,800	3,60,000	Replacement 200m pedestrian guard rail annually | Rs 1800/- per RM
3.3		MBCB Inspection and Service						
		Cleaning, clearing of dirt, routine maintenance	Daily	No-month	420	2,357	9,90,000	Total 5 labours for cleaning work of MBCB | Labour wages - Rs 550/-
		Replacement	Upon Occurrence	RM	280	2,500	7,00,000	Replacement of 200 m of MBCB | Rs 2500/- Per RM
3.4		Pavement Marking - Reflectivity / Fading	1X Year	Sqm	10373	410	42,52,930	New pavement marking for entire section for (2 times in addition to 3 cycles of MMR)
3.5		Kerb Painting	1X Year	Sqm	7467	115	8,58,667	Kerb painting for applicable sections (3 times in addition to 3 cycles of MMR)
3.6		Road Studs Replacement	1X Year	No.	3333	280	9,33,333	Capex cost of stud installation after MMR this year, 2nd and 3rd cycle is considered. Replacement of 20000 nos. of Road studs twice | RS 280/- per nos.
3.7		Delineators - Maintenance		No.	0	1,200	-	Maintenance/Replacement of 20 delineators per year
3.8		Solar Blinkers		No.	0	1,700	-	Maintenance of 3 solar blinkers per year

Item No	Item Head	Description	Frequency	Unit (per annum)	Qty	Rate	Amount per year, INR	Remarks
					Total Cost for Traffic Services		**1,20,34,429**	
4	**DRAINAGE**	**3.77%**						
4.1		Clean Drainage Structures	2 x Annually	Km	19.075	12,262	2,33,906	2 teams of 5 person cleaning 17 km drain twice in a year pre/post monsoon with 550 of daily wages
4.2		Weep Hole Cleaning	2 x Annually	No.	6	7,333	44,000	2 teams of 2 person cleaning weep holes at every structure locations twice in a year pre/post monsoon with 550 of daily wages
4.3		Replacement of drain cover	2 x Annually	RM	476.875	2,100	10,01,438	Replacement of drain cover for 15% of total drain length of 19.075 Km on both side | Annually
					Total Cost for Traffic Services		**12,79,343**	
5	**VEGETATION AND AESTHETICS (Median & Avenue Plantation)**	**8%**						
5.1		Replacement of dead plants	Annually	No.	2000	140	2,80,000	Replacement of 200 plants per year
5.2		Maintenance of existing plant		Km-month	394	3,341	13,15,200	
		Watering of plant						Total 3 labours for watering of plant | Labour wages - Rs 550/-
		Application of Fungiside/pestiside/Fertilizer						
		Training and pruning of plants						
5.3		Unwanted grass removal (median & road side)		Km-month	178	5,552	9,90,000	Total 5 labours for removal of unwanted grass | Labour wages - Rs 550/-
					Total Cost for Vegetation and Asthetics		**25,85,200**	
6	**BRIDGE/STRUCTURES**	**6%**						
6.1		Routine maintenance of structures						
		Cleaning, clearing slab/ box type culverts and pipe culverts including clearing, cleaning and reshapping of upstream and down stream faces of these culverts with in rights of way. The job includes disposal of excess material recovered from site.		Nos	79	550	86,900	
		Cleaning, clearing of bridges reshapping of upstream and down stream faces , Cleaning debris vegitation ,clogging drainange spout etc /Including cleaning of expansion joint and Bearing when applicable The job includes disposal of excess material recovered from site.		Nos	8	2,200	35,200	
		Providing & laying 300 mm thick stone pitching covering the slopes of guide bunds or other location to MOST Specification Clause No. 2504 complete in all respect as directed by the Engineer.		Cum	283	1,255	3,55,066	
		Drainange spout Replacement		Cum	2	1,736	3,472	
		Crash Barrier M40 with reinforcement		nos	50	17,000	8,50,000	
		Patch work for Structure		Rm	100	200	20,000	
		Cement Grouting for crack sealing and spalling of concrete.		sqm	50	450	22,500	
		Reconstruction of damaged head wall PCC M 15		Kg	125	3,984	4,98,000	
					Total cost for Bridges/Structures		**18,71,138**	
7	**REST AREA / Toll Plaza/Ancillary F**	**8%**						
7.1		Toilet Inspections and repairs	Monthly	No	8	6,000	48,000	6% of the capital cost
7.2		Defects of Sanitary /Electrical /Water installations	Monthly	Lumsum	4	2,02,500	8,10,000	6% of the capital cost
7.3		Toll Collection System / Lighting	Monthly					
7.4		Toll Plaza & Admin Building Painting	Monthly					
7.5		Damage to Toll Plaza, Canopy	Monthly					
7.6		Toll Plaza Maintenace i.e. WIM, SWB, Canopy	Monthly	Lane-month	672	2,000	13,44,000	Only Toll Building Canopy Maintenance (No WIM and SWB)
7.7		Damage/Deterioration of Busbays/Truck Layby/Traffic Aid Posts/Medical Aid Posts etc	Monthly	Lumsum	-	2,46,000	2,46,000	6% of the capital cost
7.8		Control Centre Maintenenace	Monthly	No-month	48	5,000	2,40,000	
					Total Cost for RA/TP/Ancillary		**26,88,000**	
8	**MISCELLANEOUS**	**0.56%**						
8.1		Structure Inspections	Pre / Post Monsoon	Km	238	303	72,000	Structure inspection for 2 times a year

Item No	Item Head	Description	Frequency	Unit (per annum)	Qty	Rate	Amount per year, INR	Remarks
